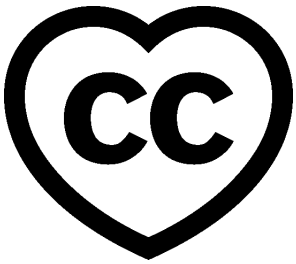
Introduction to Ada: Laboratories

Release 2024-03

Gustavo A. Hoffmann

Mar 30, 2024

CONTENTS:



These labs contain exercises for the Introduction to Ada course.

This document was written by Gustavo A. Hoffmann and reviewed by Michael Frank.

Note: The code examples in this course use an 80-column limit, which is a typical limit for Ada code. Note that, on devices with a small screen size, some code examples might be difficult to read.

CHAPTER

ONE

IMPERATIVE LANGUAGE

For the exercises below (except for the first one), don't worry about the details of the `Main` procedure. You should just focus on implementing the application in the subprogram specified by the exercise.

1.1 Hello World

Goal: create a "Hello World!" application.

Steps:

1. Complete the `Main` procedure.

Requirements:

1. The application must display the message "Hello World!".

Listing 1: main.adb

```
with Ada.Text_IO; use Ada.Text_IO;

procedure Main is
begin
   --  Implement the application here!
   null;
end Main;
```

1.2 Greetings

Goal: create an application that greets a person.

Steps:

1. Complete the `Greet` procedure.

Requirements:

1. Given an input string <name>, procedure `Greet` must display the message "Hello <name>!".
    1. For example, if the name is "John", it displays the message "Hello John!".

Remarks:

1. You can use the concatenation operator (`&`).

Listing 2: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

procedure Main is

   procedure Greet (Name : String) is
   begin
      --  Implement the application here!
      null;
   end Greet;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Greet (Argument (1));
end Main;
```

1.3 Positive Or Negative

Goal: create an application that classifies integer numbers.

Steps:

1. Complete the `Classify_Number` procedure.

Requirements:

1. Given an integer number `X`, procedure `Classify_Number` must classify `X` as positive, negative or zero and display the result:
    1. If `X > 0`, it displays `Positive`.
    2. If `X < 0`, it displays `Negative`.
    3. If `X = 0`, it displays `Zero`.

Listing 3: classify_number.ads

```
procedure Classify_Number (X : Integer);
```

Listing 4: classify_number.adb

```
with Ada.Text_IO; use Ada.Text_IO;

procedure Classify_Number (X : Integer) is
begin
   --  Implement the application here!
   null;
end Classify_Number;
```

Listing 5: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Classify_Number;

procedure Main is
   A : Integer;
begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   A := Integer'Value (Argument (1));

   Classify_Number (A);
end Main;
```

1.4 Numbers

Goal: create an application that displays numbers in a specific order.

Steps:

1. Complete the `Display_Numbers` procedure.

Requirements:

1. Given two integer numbers, `Display_Numbers` displays all numbers in the range starting with the smallest number.

Listing 6: display_numbers.ads

```
procedure Display_Numbers (A, B : Integer);
```

Listing 7: display_numbers.adb

```
procedure Display_Numbers (A, B : Integer) is
begin
   --  Implement the application here!
   null;
end Display_Numbers;
```

Listing 8: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Display_Numbers;

procedure Main is
   A, B : Integer;
begin
   if Argument_Count < 2 then
      Put_Line ("ERROR: missing arguments! Exiting...");
```

(continues on next page)

(continued from previous page)

```
      return;
   elsif Argument_Count > 2 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   A := Integer'Value (Argument (1));
   B := Integer'Value (Argument (2));

   Display_Numbers (A, B);
end Main;
```

CHAPTER

TWO

SUBPROGRAMS

2.1 Subtract procedure

Goal: write a procedure that subtracts two numbers.

Steps:

1. Complete the procedure `Subtract`.

Requirements:

1. `Subtract` performs the operation `A - B`.

Listing 1: subtract.ads

```
--  Write the correct parameters for the procedure below.
procedure Subtract;
```

Listing 2: subtract.adb

```
procedure Subtract is
begin
   --  Implement the procedure here.
   null;
end Subtract;
```

Listing 3: main.adb

```
with Ada.Command_Line;     use Ada.Command_Line;
with Ada.Text_IO;          use Ada.Text_IO;

with Subtract;

procedure Main is
   type Test_Case_Index is
     (Sub_10_1_Chk,
      Sub_10_100_Chk,
      Sub_0_5_Chk,
      Sub_0_Minus_5_Chk);

   procedure Check (TC : Test_Case_Index) is
      Result : Integer;
   begin
      case TC is
      when Sub_10_1_Chk =>
         Subtract (10, 1, Result);
         Put_Line ("Result: " & Integer'Image (Result));
      when Sub_10_100_Chk =>
         Subtract (10, 100, Result);
```

(continues on next page)

(continued from previous page)

```
         Put_Line ("Result: " & Integer'Image (Result));
      when Sub_0_5_Chk =>
         Subtract (0, 5, Result);
         Put_Line ("Result: " & Integer'Image (Result));
      when Sub_0_Minus_5_Chk =>
         Subtract (0, -5, Result);
         Put_Line ("Result: " & Integer'Image (Result));
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

2.2 Subtract function

Goal: write a function that subtracts two numbers.

Steps:

1. Rewrite the `Subtract` procedure from the previous exercise as a function.

Requirements:

1. `Subtract` performs the operation `A - B` and returns the result.

Listing 4: subtract.ads

```
--  Write the correct signature for the function below.
--  Don't forget to replace the keyword "procedure" by "function."
procedure Subtract;
```

Listing 5: subtract.adb

```
procedure Subtract is
begin
   --  Implement the function here!
   null;
end Subtract;
```

Listing 6: main.adb

```
with Ada.Command_Line;     use Ada.Command_Line;
with Ada.Text_IO;          use Ada.Text_IO;

with Subtract;

procedure Main is
   type Test_Case_Index is
     (Sub_10_1_Chk,
      Sub_10_100_Chk,
      Sub_0_5_Chk,
```

(continues on next page)

(continued from previous page)

```
      Sub_0_Minus_5_Chk);

   procedure Check (TC : Test_Case_Index) is
      Result : Integer;
   begin
      case TC is
      when Sub_10_1_Chk =>
         Result := Subtract (10, 1);
         Put_Line ("Result: " & Integer'Image (Result));
      when Sub_10_100_Chk =>
         Result := Subtract (10, 100);
         Put_Line ("Result: " & Integer'Image (Result));
      when Sub_0_5_Chk =>
         Result := Subtract (0, 5);
         Put_Line ("Result: " & Integer'Image (Result));
      when Sub_0_Minus_5_Chk =>
         Result := Subtract (0, -5);
         Put_Line ("Result: " & Integer'Image (Result));
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

2.3 Equality function

Goal: write a function that compares two values and returns a flag.

Steps:

1. Complete the `Is_Equal` subprogram.

Requirements:

1. `Is_Equal` returns a flag as a **`Boolean`** value.
2. The flag must indicate whether the values are equal (flag is **`True`**) or not (flag is **`False`**).

Listing 7: is_equal.ads

```
--  Write the correct signature for the function below.
--  Don't forget to replace the keyword "procedure" by "function."
procedure Is_Equal;
```

Listing 8: is_equal.adb

```
procedure Is_Equal is
begin
   --  Implement the function here!
   null;
end Is_Equal;
```

Listing 9: main.adb

```
with Ada.Command_Line;     use Ada.Command_Line;
with Ada.Text_IO;          use Ada.Text_IO;

with Is_Equal;

procedure Main is
   type Test_Case_Index is
     (Equal_Chk,
      Inequal_Chk);

   procedure Check (TC : Test_Case_Index) is

      procedure Display_Equal (A, B  : Integer;
                               Equal : Boolean) is
      begin
         Put (Integer'Image (A));
         if Equal then
            Put (" is equal to ");
         else
            Put (" isn't equal to ");
         end if;
         Put_Line (Integer'Image (B) & ".");
      end Display_Equal;

      Result : Boolean;
   begin
      case TC is
      when Equal_Chk =>
         for I in 0 .. 10 loop
            Result := Is_Equal (I, I);
            Display_Equal (I, I, Result);
         end loop;
      when Inequal_Chk =>
         for I in 0 .. 10 loop
            Result := Is_Equal (I, I - 1);
            Display_Equal (I, I - 1, Result);
         end loop;
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

2.4 States

Goal: write a procedure that displays the state of a machine.

Steps:

1. Complete the procedure `Display_State`.

Requirements:

1. The states can be set according to the following numbers:

Number	State
0	Off
1	On: Simple Processing
2	On: Advanced Processing

2. The procedure `Display_State` receives the number corresponding to a state and displays the state (indicated by the table above) as a user message.

Remarks:

1. You can use a case statement to implement this procedure.

Listing 10: display_state.ads

```
procedure Display_State (State : Integer);
```

Listing 11: display_state.adb

```
with Ada.Text_IO; use Ada.Text_IO;

procedure Display_State (State : Integer) is
begin
   null;
end Display_State;
```

Listing 12: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Display_State;

procedure Main is
   State : Integer;
begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   State := Integer'Value (Argument (1));

   Display_State (State);
end Main;
```

2.5 States #2

Goal: write a function that returns the state of a machine.

Steps:

1. Implement the function `Get_State`.

Requirements:

1. Implement same state machine as in the previous exercise.
2. Function `Get_State` must return the state as a string.

Remarks:

1. You can implement a function returning a string by simply using quotes in a return statement. For example:

Listing 13: get_hello.ads

```
function Get_Hello return String;
```

Listing 14: get_hello.adb

```
function Get_Hello return String is
begin
   return "Hello";
end Get_Hello;
```

Listing 15: main.adb

```
with Ada.Text_IO;      use Ada.Text_IO;
with Get_Hello;

procedure Main is
   S : constant String := Get_Hello;
begin
   Put_Line (S);
end Main;
```

2. You can reuse your previous implementation and replace it by a case expression.
    1. For values that do not correspond to a state, you can simply return an empty string (`""`).

Listing 16: get_state.ads

```
function Get_State (State : Integer) return String;
```

Listing 17: get_state.adb

```
function Get_State (State : Integer) return String is
begin
   return "";
end Get_State;
```

Listing 18: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Get_State;
```

(continues on next page)

(continued from previous page)

```
5
6  procedure Main is
7     State : Integer;
8  begin
9     if Argument_Count < 1 then
10       Put_Line ("ERROR: missing arguments! Exiting...");
11       return;
12    elsif Argument_Count > 1 then
13       Put_Line ("Ignoring additional arguments...");
14    end if;
15
16    State := Integer'Value (Argument (1));
17
18    Put_Line (Get_State (State));
19 end Main;
```

2.6 States #3

Goal: implement an on/off indicator for a state machine.

Steps:

1. Implement the function `Is_On`.
2. Implement the procedure `Display_On_Off`.

Requirements:

1. Implement same state machine as in the previous exercise.
2. Function `Is_On` returns:
   - **`True`** if the machine is on;
   - otherwise, it returns **`False`**.
3. Procedure `Display_On_Off` displays the message
   - "On" if the machine is on, or
   - "Off" otherwise.
4. `Is_On` must be called in the implementation of `Display_On_Off`.

Remarks:

1. You can implement both subprograms using if expressions.

Listing 19: is_on.ads

```
1  function Is_On (State : Integer) return Boolean;
```

Listing 20: is_on.adb

```
1  function Is_On (State : Integer) return Boolean is
2  begin
3     return False;
4  end Is_On;
```

Listing 21: display_on_off.ads

```
1  procedure Display_On_Off (State : Integer);
```

Listing 22: display_on_off.adb

```
with Ada.Text_IO; use Ada.Text_IO;
with Is_On;

procedure Display_On_Off (State : Integer) is
begin
   Put_Line ("");
end Display_On_Off;
```

Listing 23: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Display_On_Off;
with Is_On;

procedure Main is
   State : Integer;
begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   State := Integer'Value (Argument (1));

   Display_On_Off (State);
   Put_Line (Boolean'Image (Is_On (State)));
end Main;
```

2.7 States #4

Goal: implement a procedure to update the state of a machine.

Steps:

1. Implement the procedure `Set_Next`.

Requirements:

1. Implement the same state machine as in the previous exercise.
2. Procedure `Set_Next` updates the machine's state with the next one in a *circular* manner:
   - In most cases, the next state of `N` is simply the next number (`N + 1`).
   - However, if the state is the last one (which is 2 for our machine), the next state must be the first one (in our case: 0).

Remarks:

1. You can use an if expression to implement `Set_Next`.

Listing 24: set_next.ads

```
procedure Set_Next (State : in out Integer);
```

Listing 25: set_next.adb

```
procedure Set_Next (State : in out Integer) is
begin
   null;
end Set_Next;
```

Listing 26: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Set_Next;

procedure Main is
   State : Integer;
begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   State := Integer'Value (Argument (1));

   Set_Next (State);
   Put_Line (Integer'Image (State));
end Main;
```

CHAPTER

THREE

MODULAR PROGRAMMING

3.1 Months

Goal: create a package to display the months of the year.

Steps:

1. Convert the `Months` procedure below to a package.
2. Create the specification and body of the `Months` package.

Requirements:

1. `Months` must contain the declaration of strings for each month of the year, which are stored in three-character constants based on the month's name.
    - For example, the string `"January"` is stored in the constant `Jan`. These strings are then used by the `Display_Months` procedure, which is also part of the `Months` package.

Remarks:

1. The goal of this exercise is to create the `Months` package.
    1. In the code below, `Months` is declared as a procedure.
        - Therefore, we need to *convert* it into a real package.
    2. You have to modify the procedure declaration and implementation in the code below, so that it becomes a package specification and a package body.

Listing 1: months.ads

```
--  Create specification for Months package, which includes
--  the declaration of the Display_Months procedure.
--
procedure Months;
```

Listing 2: months.adb

```
--  Create body of Months package, which includes
--  the implementation of the Display_Months procedure.
--
procedure Months is

   procedure Display_Months is
   begin
      Put_Line ("Months:");
      Put_Line ("- " & Jan);
      Put_Line ("- " & Feb);
      Put_Line ("- " & Mar);
```

(continues on next page)

(continued from previous page)

```
      Put_Line ("- " & Apr);
      Put_Line ("- " & May);
      Put_Line ("- " & Jun);
      Put_Line ("- " & Jul);
      Put_Line ("- " & Aug);
      Put_Line ("- " & Sep);
      Put_Line ("- " & Oct);
      Put_Line ("- " & Nov);
      Put_Line ("- " & Dec);
   end Display_Months;

begin
   null;
end Months;
```

Listing 3: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Months;           use Months;

procedure Main is

   type Test_Case_Index is
     (Months_Chk);

   procedure Check (TC : Test_Case_Index) is
   begin
      case TC is
         when Months_Chk =>
            Display_Months;
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

3.2 Operations

Goal: create a package to perform basic mathematical operations.

Steps:

1. Implement the `Operations` package.
    1. Declare and implement the `Add` function.
    2. Declare and implement the `Subtract` function.
    3. Declare and implement the `Multiply`: function.

4. Declare and implement the `Divide` function.

2. Implement the `Operations.Test` package
    1. Declare and implement the `Display` procedure.

Requirements:

1. Package `Operations` contains functions for each of the four basic mathematical operations for parameters of **`Integer`** type:
    1. Function `Add` performs the addition of `A` and `B` and returns the result;
    2. Function `Subtract` performs the subtraction of `A` and `B` and returns the result;
    3. Function `Multiply` performs the multiplication of `A` and `B` and returns the result;
    4. Function `Divide` performs the division of `A` and `B` and returns the result.
2. Package `Operations.Test` contains the test environment:
    1. Procedure `Display` must use the functions from the parent (`Operations`) package as indicated by the template in the code below.

Listing 4: operations.ads

```
package Operations is

   --  Create specification for Operations package, including the
   --  declaration of the functions mentioned above.
   --

end Operations;
```

Listing 5: operations.adb

```
package body Operations is

   --  Create body of Operations package.
   --

end Operations;
```

Listing 6: operations-test.ads

```
package Operations.Test is

   --  Create specification for Operations package, including the
   --  declaration of the Display procedure:
   --
   --   procedure Display (A, B : Integer);
   --

end Operations.Test;
```

Listing 7: operations-test.adb

```
package body Operations.Test is

   --  Implement body of Operations.Test package.
   --

   procedure Display (A, B : Integer) is
      A_Str : constant String := Integer'Image (A);
      B_Str : constant String := Integer'Image (B);
```

(continues on next page)

(continued from previous page)

```
   begin
      Put_Line ("Operations:");
      Put_Line (A_Str & " + " & B_Str & " = "
                & Integer'Image (Add (A, B))
                & ",");
      --  Use the line above as a template and add the rest of the
      --  implementation for Subtract, Multiply and Divide.
   end Display;

end Operations.Test;
```

Listing 8: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Operations;
with Operations.Test;  use Operations.Test;

procedure Main is

   type Test_Case_Index is
     (Operations_Chk,
      Operations_Display_Chk);

   procedure Check (TC : Test_Case_Index) is
   begin
      case TC is
         when Operations_Chk =>
            Put_Line ("Add (100, 2) = "
                      & Integer'Image (Operations.Add (100, 2)));
            Put_Line ("Subtract (100, 2) = "
                      & Integer'Image (Operations.Subtract (100, 2)));
            Put_Line ("Multiply (100, 2) = "
                      & Integer'Image (Operations.Multiply (100, 2)));
            Put_Line ("Divide (100, 2) = "
                      & Integer'Image (Operations.Divide (100, 2)));
         when Operations_Display_Chk =>
            Display (10, 5);
            Display ( 1, 2);
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

CHAPTER

FOUR

STRONGLY TYPED LANGUAGE

4.1 Colors

Goal: create a package to represent HTML colors in hexadecimal form and its corresponding names.

Steps:

1. Implement the `Color_Types` package.
    1. Declare the `HTML_Color` enumeration.
    2. Declare the `Basic_HTML_Color` enumeration.
    3. Implement the `To_Integer` function.
    4. Implement the `To_HTML_Color` function.

Requirements:

1. Enumeration `HTML_Color` has the following colors:
    - Salmon
    - Firebrick
    - Red
    - Darkred
    - Lime
    - Forestgreen
    - Green
    - Darkgreen
    - Blue
    - Mediumblue
    - Darkblue
2. Enumeration `Basic_HTML_Color` has the following colors: Red, Green, Blue.
3. Function `To_Integer` converts from the `HTML_Color` type to the HTML color code — as integer values in hexadecimal notation.
    - You can find the HTML color codes in the table below.
4. Function `To_HTML_Color` converts from `Basic_HTML_Color` to `HTML_Color`.
5. This is the table to convert from an HTML color to a HTML color code in hexadecimal notation:

Color	HTML color code (hexa)
Salmon	#FA8072
Firebrick	#B22222
Red	#FF0000
Darkred	#8B0000
Lime	#00FF00
Forestgreen	#228B22
Green	#008000
Darkgreen	#006400
Blue	#0000FF
Mediumblue	#0000CD
Darkblue	#00008B

Remarks:

1. In order to express the hexadecimal values above in Ada, use the following syntax: 16#<hex_value># (e.g.: `16#FFFFFF#`).
2. For function `To_Integer`, you may use a **`case`** for this.

Listing 1: color_types.ads

```
package Color_Types is

   --  Include type declaration for HTML_Color!
   --
   --  type HTML_Color is [...]
   --

   --  Include function declaration for:
   --  function To_Integer (C : HTML_Color) return Integer;

   --  Include type declaration for Basic_HTML_Color!
   --
   --  type Basic_HTML_Color is [...]
   --

   --  Include function declaration for:
   --  - Basic_HTML_Color => HTML_Color
   --
   --  function To_HTML_Color [...];
   --
end Color_Types;
```

Listing 2: color_types.adb

```
package body Color_Types is

   --  Implement the conversion from HTML_Color to Integer here!
   --
   --  function To_Integer (C : HTML_Color) return Integer is
   --  begin
   --  --  Hint: use 'case' for the HTML colors;
   --  --        use 16#...# for the hexadecimal values.
   --  end To_Integer;

   --  Implement the conversion from Basic_HTML_Color to HTML_Color here!
   --
   --  function To_HTML_Color [...] is
```

(continues on next page)

(continued from previous page)

```
   --
end Color_Types;
```

Listing 3: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;
with Ada.Integer_Text_IO;

with Color_Types; use Color_Types;

procedure Main is
   type Test_Case_Index is
     (HTML_Color_Range,
      HTML_Color_To_Integer,
      Basic_HTML_Color_To_HTML_Color);

   procedure Check (TC : Test_Case_Index) is
   begin
      case TC is
         when HTML_Color_Range =>
            for I in HTML_Color'Range loop
               Put_Line (HTML_Color'Image (I));
            end loop;
         when HTML_Color_To_Integer =>
            for I in HTML_Color'Range loop
               Ada.Integer_Text_IO.Put (Item  => To_Integer (I),
                                        Width => 6,
                                        Base  => 16);
               New_Line;
            end loop;
         when Basic_HTML_Color_To_HTML_Color =>
            for I in Basic_HTML_Color'Range loop
               Put_Line (HTML_Color'Image (To_HTML_Color (I)));
            end loop;
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

4.2 Integers

Goal: implement a package with various integer types.

Steps:

1. Implement the `Int_Types` package.
    1. Declare the integer type `I_100`.
    2. Declare the modular type `U_100`.
    3. Implement the `To_I_100` function to convert from the `U_100` type.
    4. Implement the `To_U_100` function to convert from the `I_100` type.
    5. Declare the derived type `D_50`.
    6. Declare the subtype `S_50`.
    7. Implement the `To_D_50` function to convert from the `I_100` type.
    8. Implement the `To_S_50` function to convert from the `I_100` type.
    9. Implement the `To_I_100` function to convert from the `D_50` type.

Requirements:

1. Types `I_100` and `U_100` have values between 0 and 100.
    1. Type `I_100` is an integer type.
    2. Type `U_100` is a modular type.
2. Function `To_I_100` converts from the `U_100` type to the `I_100` type.
3. Function `To_U_100` converts from the `I_100` type to the `U_100` type.
4. Types `D_50` and `S_50` have values between 10 and 50 and use `I_100` as a base type.
    1. `D_50` is a derived type.
    2. `S_50` is a subtype.
5. Function `To_D_50` converts from the `I_100` type to the `D_50` type.
6. Function `To_S_50` converts from the `I_100` type to the `S_50` type.
7. Functions `To_D_50` and `To_S_50` saturate the input values if they are out of range.
    - If the input is less than 10 the output should be 10.
    - If the input is greater than 50 the output should be 50.
8. Function `To_I_100` converts from the `D_50` type to the `I_100` type.

Remarks:

1. For the implementation of functions `To_D_50` and `To_S_50`, you may use the type attributes `D_50'First` and `D_50'Last`:
    1. `D_50'First` indicates the minimum value of the `D_50` type.
    2. `D_50'Last` indicates the maximum value of the `D_50` type.
    3. The same attributes are available for the `S_50` type (`S_50'First` and `S_50'Last`).
2. We could have implemented a function `To_I_100` as well to convert from `S_50` to `I_100`. However, we skip this here because explicit conversions are not needed for subtypes.

Listing 4: int_types.ads

```
package Int_Types is

   --  Include type declarations for I_100 and U_100!
   --
   --  type I_100 is [...]
   --  type U_100 is [...]
   --

   function To_I_100 (V : U_100) return I_100;

   function To_U_100 (V : I_100) return U_100;

   --  Include type declarations for D_50 and S_50!
   --
   --  [...] D_50 is [...]
   --  [...] S_50 is [...]
   --

   function To_D_50 (V : I_100) return D_50;

   function To_S_50 (V : I_100) return S_50;

   function To_I_100 (V : D_50) return I_100;

end Int_Types;
```

Listing 5: int_types.adb

```
package body Int_Types is

   function To_I_100 (V : U_100) return I_100 is
   begin
      --  Implement the conversion from U_100 to I_100 here!
      --
      null;
   end To_I_100;

   function To_U_100 (V : I_100) return U_100 is
   begin
      --  Implement the conversion from I_100 to U_100 here!
      --
      null;
   end To_U_100;

   function To_D_50 (V : I_100) return D_50 is
      Min : constant I_100 := I_100 (D_50'First);
      Max : constant I_100 := I_100 (D_50'Last);
   begin
      --  Implement the conversion from I_100 to D_50 here!
      --
      --  Hint: using the constants above simplifies the checks needed for
      --        this function.
      --
      null;
   end To_D_50;

   function To_S_50 (V : I_100) return S_50 is
   begin
      --  Implement the conversion from I_100 to S_50 here!
```

(continues on next page)

(continued from previous page)

```

      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
```

(continues on next page)

(continued from previous page)

```
102 end Main;
```

4.3 Temperatures

Goal: create a package to handle temperatures in Celsius and Kelvin.

Steps:

1. Implement the `Temperature_Types` package.
    1. Declare the `Celsius` type.
    2. Declare the `Int_Celsius` type.
    3. Implement the `To_Celsius` function.
    4. Implement the `To_Int_Celsius` function.
    5. Declare the `Kelvin` type.
    6. Implement the `To_Celsius` function to convert from the `Kelvin` type.
    7. Implement the `To_Kelvin` function.

Requirements:

1. The custom floating-point types declared in `Temperature_Types` must use a precision of six digits.
2. Types `Celsius` and `Int_Celsius` are used for temperatures in Celsius:
    1. `Celsius` is a floating-point type with a range between -273.15 and 5504.85.
    2. `Int_Celsius` is an integer type with a range between -273 and 5505.
3. Functions `To_Celsius` and `To_Int_Celsius` are used for type conversion:
    1. `To_Celsius` converts from `Int_Celsius` to `Celsius` type.
    2. `To_Int_Celsius` converts from `Celsius` and `Int_Celsius` types:
4. `Kelvin` is a floating-point type for temperatures in Kelvin using a range between 0.0 and 5778.0.
5. The functions `To_Celsius` and `To_Kelvin` are used to convert between temperatures in `Kelvin` and `Celsius`.
    1. In order to convert temperatures in Celsius to Kelvin, you must use the formula $K = C + 273.15$, where:
        - K is the temperature in Kelvin, and
        - C is the temperature in Celsius.

Remarks:

1. When implementing the `To_Celsius` function for the `Int_Celsius` type:
    1. You'll need to check for the minimum and maximum values of the input values because of the slightly different ranges.
    2. You may use variables of floating-point type (`Float`) for intermediate values.
2. For the implementation of the functions `To_Celsius` and `To_Kelvin` (used for converting between `Kelvin` and `Celsius`), you may use a variable of floating-point type (`Float`) for intermediate values.

Listing 7: temperature_types.ads

```
package Temperature_Types is

   --  Include type declaration for Celsius!
   --
   --  Celsius is [...];
       --  Int_Celsius is [...];
   --

   function To_Celsius (T : Int_Celsius) return Celsius;

   function To_Int_Celsius (T : Celsius) return Int_Celsius;

   --  Include type declaration for Kelvin!
   --
   --  type Kelvin is [...];
   --

   --  Include function declarations for:
   --  - Kelvin  => Celsius
   --  - Celsius => Kelvin
   --
   --  function To_Celsius [...];
   --  function To_Kelvin  [...];
   --
end Temperature_Types;
```

```

CHAPTER

FIVE

RECORDS

5.1 Directions

Goal: create a package that handles directions and geometric angles.

Steps:

1. Implement the `Directions` package.
    1. Declare the `Ext_Angle` record.
    2. Implement the `Display` procedure.
    3. Implement the `To_Ext_Angle` function.

Requirements:

1. Record `Ext_Angle` stores information about the extended angle (see remark about *extended angles* below).
2. Procedure `Display` displays information about the extended angle.
    1. You should use the implementation that has been commented out (see code below) as a starting point.
3. Function `To_Ext_Angle` converts a simple angle value to an extended angle (`Ext_Angle` type).

Remarks:

1. We make use of the algorithm implemented in the `Check_Direction` procedure (chapter on imperative language).
2. For the sake of this exercise, we use the concept of *extended angles*. This includes the actual geometric angle and the corresponding direction (North, South, Northwest, and so on).

Listing 1: directions.ads

```
1  package Directions is
2
3     type Angle_Mod is mod 360;
4
5     type Direction is
6       (North,
7        Northeast,
8        East,
9        Southeast,
10       South,
11       Southwest,

```

5.2 Colors

Goal: create a package to represent HTML colors in RGB format using the hexadecimal form.

Steps:

1. Implement the `Color_Types` package.
    1. Declare the RGB record.
    2. Implement the `To_RGB` function.
    3. Implement the `Image` function for the RGB type.

Requirements:

1. The following table contains the HTML colors and the corresponding value in hexadecimal form for each color element:

Color	Red	Green	Blue
Salmon	#FA	#80	#72
Firebrick	#B2	#22	#22
Red	#FF	#00	#00
Darkred	#8B	#00	#00
Lime	#00	#FF	#00
Forestgreen	#22	#8B	#22
Green	#00	#80	#00
Darkgreen	#00	#64	#00
Blue	#00	#00	#FF
Mediumblue	#00	#00	#CD
Darkblue	#00	#00	#8B

2. The hexadecimal information of each HTML color can be mapped to three color elements: red, green and blue.
    1. Each color element has a value between 0 and 255, or `00` and FF in hexadecimal.
    2. For example, for the color *salmon*, the hexadecimal value of the color elements are:
        - red = FA,
        - green = 80, and
        - blue = 72.
3. Record RGB stores information about HTML colors in RGB format, so that we can retrieve the individual color elements.
4. Function `To_RGB` converts from the `HTML_Color` enumeration to the RGB type based on the information from the table above.
5. Function `Image` returns a string representation of the RGB type in this format:
    - `"(Red => 16#..#, Green => 16#...#, Blue => 16#...# )"`

Remarks:

1. We use the exercise on HTML colors from the previous lab on *Strongly typed language* (page 21) as a starting point.

Listing 4: color_types.ads

```
1  package Color_Types is
2
3     type HTML_Color is
4       (Salmon,
5        Firebrick,
6        Red,
7        Darkred,
8        Lime,
9        Forestgreen,
10       Green,
11       Darkgreen,
12       Blue,
13       Mediumblue,
14       Darkblue);
15

29    Check (Test_Case_Index'Value (Argument (1)));
30 end Main;
```

5.3 Inventory

Goal: create a simplified inventory system for a store to enter items and keep track of assets.

Steps:

1. Implement the `Inventory_Pkg` package.
    1. Declare the `Item` record.
    2. Implement the `Init` function.
    3. Implement the `Add` procedure.

Requirements:

1. Record `Item` collects information about products from the store.
    1. To keep it simple, this record only contains the name, quantity and price of each item.
    2. The record components are:
        - `Name` of `Item_Name` type;
        - `Quantity` of **`Natural`** type;
        - `Price` of **`Float`** type.
2. Function `Init` returns an initialized item (of `Item` type).
    1. Function `Init` must also display the item name by calling the `To_String` function for the `Item_Name` type.
        - This is already implemented in the code below.
3. Procedure `Add` adds an item to the assets.
    1. Since we want to keep track of the assets, the implementation must accumulate the total value of each item's inventory, the result of multiplying the item quantity and its price.

Listing 7: inventory_pkg.ads

```
package Inventory_Pkg is

   type Item_Name is
     (Ballpoint_Pen, Oil_Based_Pen_Marker, Feather_Quill_Pen);

   function To_String (I : Item_Name) return String;

   --  Replace type declaration for Item record:
   --
   type Item is null record;

   function Init (Name     : Item_Name;
                  Quantity : Natural;
                  Price    : Float) return Item;

   procedure Add (Assets : in out Float;
                  I      : Item);

end Inventory_Pkg;
```

Listing 8: inventory_pkg.adb

```
with Ada.Text_IO; use Ada.Text_IO;

package body Inventory_Pkg is

   function To_String (I : Item_Name) return String is
   begin
      case I is
         when Ballpoint_Pen        => return "Ballpoint Pen";
         when Oil_Based_Pen_Marker => return "Oil-based Pen Marker";
         when Feather_Quill_Pen    => return "Feather Quill Pen";
      end case;
   end To_String;

   function Init (Name     : Item_Name;
                  Quantity : Natural;
                  Price    : Float) return Item is
   begin
      Put_Line ("Item: " & To_String (Name) & ".");

      --  Replace return statement with the actual record initialization!
      --
      return (null record);
   end Init;

   procedure Add (Assets : in out Float;
                  I      : Item) is
   begin
      --  Implement the function that adds an item to the inventory here!
      --
      null;
   end Add;

end Inventory_Pkg;
```

Listing 9: main.adb

```

49 begin
50    if Argument_Count < 1 then
51       Put_Line ("ERROR: missing arguments! Exiting...");
52       return;
53    elsif Argument_Count > 1 then
54       Put_Line ("Ignoring additional arguments...");
55    end if;
56
57    Check (Test_Case_Index'Value (Argument (1)));
58 end Main;
```

CHAPTER

SIX

ARRAYS

6.1 Constrained Array

Goal: declare a constrained array and implement operations on it.

Steps:

1. Implement the `Constrained_Arrays` package.
    1. Declare the range type `My_Index`.
    2. Declare the array type `My_Array`.
    3. Declare and implement the `Init` function.
    4. Declare and implement the `Double` procedure.
    5. Declare and implement the `First_Elem` function.
    6. Declare and implement the `Last_Elem` function.
    7. Declare and implement the `Length` function.
    8. Declare the object `A` of `My_Array` type.

Requirements:

1. Range type `My_Index` has a range from 1 to 10.
2. `My_Array` is a constrained array of `Integer` type.
    1. It must make use of the `My_Index` type.
    2. It is therefore limited to 10 elements.
3. Function `Init` returns an array where each element is initialized with the corresponding index.
4. Procedure `Double` doubles the value of each element of an array.
5. Function `First_Elem` returns the first element of the array.
6. Function `Last_Elem` returns the last element of the array.
7. Function `Length` returns the length of the array.
8. Object `A` of `My_Array` type is initialized with:
    1. the values 1 and 2 for the first two elements, and
    2. 42 for all other elements.

Listing 1: constrained_arrays.ads

```
package Constrained_Arrays is

   --  Complete the type and subprogram declarations:
   --
   --  type My_Index is [...]
   --
   --  type My_Array is [...]
   --
   --  function Init ...
   --
   --  procedure Double ...
   --
   --  function First_Elem ...
   --
   --  function Last_Elem ...
   --
   --  function Length ...
   --
   --  A : ...

end Constrained_Arrays;
```

            Put_Line (My_Index'Image (I));
         end loop;
      when A_Obj_Chk =>
         Display (A);
      when Init_Chk =>
         AA := Init;
         Display (AA);
      when Double_Chk =>
         Local_Init (AA);
         Double (AA);
         Display (AA);
      when First_Elem_Chk =>
         Local_Init (AA);
         Put_Line (Integer'Image (First_Elem (AA)));
      when Last_Elem_Chk =>
         Local_Init (AA);
         Put_Line (Integer'Image (Last_Elem (AA)));
      when Length_Chk =>
         Put_Line (Integer'Image (Length (AA)));
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

6.2 Colors: Lookup-Table

Goal: rewrite a package to represent HTML colors in RGB format using a lookup table.

Steps:

1. Implement the `Color_Types` package.
    1. Declare the array type `HTML_Color_RGB`.
    2. Declare the `To_RGB_Lookup_Table` object and initialize it.
    3. Adapt the implementation of the `To_RGB` function.

Requirements:

1. Array type `HTML_Color_RGB` is used for the table.

2. The `To_RGB_Lookup_Table` object of `HTML_Color_RGB` type contains the lookup table.
   - This table must be implemented as an array of constant values.
3. The implementation of the `To_RGB` function must use the `To_RGB_Lookup_Table` object.

Remarks:

1. This exercise is based on the HTML colors exercise from a previous lab (*Records* (page 33)).
2. In the previous implementation, you could use a **`case`** statement to implement the `To_RGB` function. Here, you must rewrite the function using a look-up table.
   1. The implementation of the `To_RGB` function below includes the case statement as commented-out code. You can use this as your starting point: you just need to copy it and convert the case statement to an array declaration.
   1. Don't use a case statement to implement the `To_RGB` function. Instead, write code that accesses `To_RGB_Lookup_Table` to get the correct value.
3. The following table contains the HTML colors and the corresponding value in hexadecimal form for each color element:

Color	Red	Green	Blue
Salmon	#FA	#80	#72
Firebrick	#B2	#22	#22
Red	#FF	#00	#00

```

6.3 Unconstrained Array

Goal: declare an unconstrained array and implement operations on it.

Steps:

1. Implement the `Unconstrained_Arrays` package.
    1. Declare the `My_Array` type.
    2. Declare and implement the `Init` procedure.
    3. Declare and implement the `Init` function.

4. Declare and implement the `Double` procedure.
5. Declare and implement the `Diff_Prev_Elem` function.

Requirements:

1. `My_Array` is an unconstrained array (with a **`Positive`** range) of **`Integer`** elements.
2. Procedure `Init` initializes each element with the index starting with the last one.
   - For example, for an array of 3 elements where the index of the first element is 1 (`My_Array (1 .. 3)`), the values of these elements after a call to `Init` must be `(3, 2, 1)`.
3. Function `Init` returns an array based on the length `L` and start index `I` provided to the `Init` function.
   1. `I` indicates the index of the first element of the array.
   2. `L` indicates the length of the array.
   3. Both `I` and `L` must be positive.
   4. This is its declaration: `function Init (I, L : Positive) return My_Array;`.
   5. You must initialize the elements of the array in the same manner as for the `Init` procedure described above.
4. Procedure `Double` doubles each element of an array.
5. Function `Diff_Prev_Elem` returns — for each element of an input array `A` — an array with the difference between an element of array `A` and the previous element.
   1. For the first element, the difference must be zero.
   2. For example:
      - **INPUT**: `(2, 5, 15)`
      - **RETURN** of `Diff_Prev_Elem`: `(0, 3, 10)`, where
        - `0` is the constant difference for the first element;
        - `5 - 2 = 3` is the difference between the second and the first elements of the input array;
        - `15 - 5 = 10` is the difference between the third and the second elements of the input array.

Remarks:

1. For an array `A`, you can retrieve the index of the last element with the attribute `'Last`.
   1. For example: `Y : Positive := A'Last;`
   2. This can be useful during the implementation of procedure `Init`.
2. For the implementation of the `Init` function, you can call the `Init` procedure to initialize the elements. By doing this, you avoid code duplication.
3. Some hints about attributes:
   1. You can use the range attribute (`A'Range`) to retrieve the range of an array `A`.
   2. You can also use the range attribute in the declaration of another array (e.g.: `B : My_Array (A'Range)`).
   3. Alternatively, you can use the `A'First` and `A'Last` attributes in an array declaration.

Listing 7: unconstrained_arrays.ads

```
package Unconstrained_Arrays is

   --  Complete the type and subprogram declarations:
   --
   --  type My_Array is ...;
   --
   --  procedure Init ...;

   function Init (I, L : Positive) return My_Array;

   --  procedure Double ...;
   --
   --  function Diff_Prev_Elem ...;

end Unconstrained_Arrays;
```

26       begin
27          A := (1, 2, 5, 10, -10);
28       end Local_Init;
29
30    begin
31       case TC is
32       when Init_Chk =>
33          AA := Init (AA'First, AA'Length);
34          AB := Init (AB'First, AB'Length);
35          Display (AA);
36          Display (AB);
37       when Init_Proc_Chk =>
38          Init (AA);
39          Init (AB);
40          Display (AA);
41          Display (AB);
42       when Double_Chk =>
43          Local_Init (AB);
44          Double (AB);
45          Display (AB);
46       when Diff_Prev_Chk =>
47          Local_Init (AB);
48          AB := Diff_Prev_Elem (AB);
49          Display (AB);
50       when Diff_Prev_Single_Chk =>
51          declare
52             A1 : My_Array (1 .. 1) := (1 => 42);
53          begin
54             A1 := Diff_Prev_Elem (A1);
55             Display (A1);
56          end;
57       end case;
58    end Check;
59
60 begin
61    if Argument_Count < 1 then
62       Put_Line ("ERROR: missing arguments! Exiting...");
63       return;
64    elsif Argument_Count > 1 then
65       Put_Line ("Ignoring additional arguments...");
66    end if;
67
68    Check (Test_Case_Index'Value (Argument (1)));
69 end Main;
```

6.4 Product info

Goal: create a system to keep track of quantities and prices of products.

Steps:

1. Implement the `Product_Info_Pkg` package.
    1. Declare the array type `Product_Infos`.
    2. Declare the array type `Currency_Array`.
    3. Implement the `Total` procedure.
    4. Implement the `Total` function returning an array of `Currency_Array` type.

5. Implement the `Total` function returning a single value of `Currency` type.

Requirements:

1. Quantity of an individual product is represented by the `Quantity` subtype.
2. Price of an individual product is represented by the `Currency` subtype.
3. Record type `Product_Info` deals with information for various products.
4. Array type `Product_Infos` is used to represent a list of products.
5. Array type `Currency_Array` is used to represent a list of total values of individual products (see more details below).
6. Procedure `Total` receives an input array of products.
    1. It outputs an array with the total value of each product using the `Currency_Array` type.
    2. The total value of an individual product is calculated by multiplying the quantity for this product by its price.
7. Function `Total` returns an array of `Currency_Array` type.
    1. This function has the same purpose as the procedure `Total`.
    2. The difference is that the function returns an array instead of providing this array as an output parameter.
8. The second function `Total` returns a single value of `Currency` type.
    1. This function receives an array of products.
    2. It returns a single value corresponding to the total value for all products in the system.

Remarks:

1. You can use `Currency (Q)` to convert from an element `Q` of `Quantity` type to the `Currency` type.
    1. As you might remember, Ada requires an explicit conversion in calculations where variables of both integer and floating-point types are used.
    2. In our case, the `Quantity` subtype is based on the **`Integer`** type and the `Currency` subtype is based on the **`Float`** type, so a conversion is necessary in calculations using those types.

Listing 10: product_info_pkg.ads

```
1  package Product_Info_Pkg is
2
3     subtype Quantity is Natural;
4
5     subtype Currency is Float;
6
7     type Product_Info is record
8        Units : Quantity;
9        Price : Currency;
10    end record;
11
12    --  Complete the type declarations:
13    --
14    --  type Product_Infos is ...
15    --
16    --  type Currency_Array is ...
17
18    procedure Total (P   : Product_Infos;
```

(continues on next page)

(continued from previous page)

```
                    Tot : out Currency_Array);

   function Total (P : Product_Infos) return Currency_Array;

   function Total (P : Product_Infos) return Currency;

end Product_Info_Pkg;
```

Listing 11: product_info_pkg.adb

      procedure Display (Tots : Currency_Array) is
      begin
         for I in Tots'Range loop
            Currency_IO.Put (Tots (I));
            New_Line;
         end loop;
      end Display;

      procedure Local_Init (P : in out Product_Infos) is
      begin
         P := ((1,   0.5),
               (2,  10.0),
               (5,  40.0),
               (10, 10.0),
```

(continues on next page)

(continued from previous page)

```
35                (10, 20.0));
36       end Local_Init;
37
38    begin
39       Currency_IO.Default_Fore := 1;
40       Currency_IO.Default_Aft  := 2;
41       Currency_IO.Default_Exp  := 0;
42
43       case TC is
44       when Total_Func_Chk =>
45          Local_Init (P);
46          Tots := Total (P);
47          Display (Tots);
48       when Total_Proc_Chk =>
49          Local_Init (P);
50          Total (P, Tots);
51          Display (Tots);
52       when Total_Value_Chk =>
53          Local_Init (P);
54          Tot := Total (P);
55          Currency_IO.Put (Tot);
56          New_Line;
57       end case;
58    end Check;
59
60 begin
61    if Argument_Count < 1 then
62       Put_Line ("ERROR: missing arguments! Exiting...");
63       return;
64    elsif Argument_Count > 1 then
65       Put_Line ("Ignoring additional arguments...");
66    end if;
67
68    Check (Test_Case_Index'Value (Argument (1)));
69 end Main;
```

6.5 String_10

Goal: work with constrained string types.

Steps:

1. Implement the `Strings_10` package.
    1. Declare the `String_10` type.
    2. Implement the `To_String_10` function.

Requirements:

1. The constrained string type `String_10` is an array of ten characters.
2. Function `To_String_10` returns constrained strings of `String_10` type based on an input parameter of **`String`** type.
    - For strings that are more than 10 characters, omit everything after the 11th character.
    - For strings that are fewer than 10 characters, pad the string with ' ' characters until it is 10 characters.

Remarks:

1. Declaring `String_10` as a subtype of **`String`** is the easiest way.
   - You may declare it as a new type as well. However, this requires some adaptations in the `Main` test procedure.
2. You can use **`Integer`**`'Min` to calculate the minimum of two integer values.

Listing 13: strings_10.ads

```
package Strings_10 is

   --  Complete the type and subprogram declarations:
   --

   --  subtype String_10 is ...;

   --  Using "type String_10 is..." is possible, too. However, it
   --  requires a custom Put_Line procedure that is called in Main:
   --  procedure Put_Line (S : String_10);

   --  function To_String_10 ...;

end Strings_10;
```

Listing 14: strings_10.adb

```
package body Strings_10 is

   --  Complete the subprogram declaration and implementation:
   --
   --  function To_String_10 ... is

end Strings_10;
```

Listing 15: main.adb

```
with Ada.Command_Line;   use Ada.Command_Line;
with Ada.Text_IO;        use Ada.Text_IO;

with Strings_10;         use Strings_10;

procedure Main is
   type Test_Case_Index is
     (String_10_Long_Chk,
      String_10_Short_Chk);

   procedure Check (TC : Test_Case_Index) is
      SL   : constant String := "And this is a long string just for testing...";
      SS   : constant String := "Hey!";
      S_10 : String_10;

   begin
      case TC is
      when String_10_Long_Chk =>
         S_10 := To_String_10 (SL);
         Put_Line (String (S_10));
      when String_10_Short_Chk =>
         S_10 := (others => ' ');
         S_10 := To_String_10 (SS);
         Put_Line (String (S_10));
      end case;
   end Check;
```

(continues on next page)

(continued from previous page)

```
27
28 begin
29    if Argument_Count < 1 then
30       Ada.Text_IO.Put_Line ("ERROR: missing arguments! Exiting...");
31       return;
32    elsif Argument_Count > 1 then
33       Ada.Text_IO.Put_Line ("Ignoring additional arguments...");
34    end if;
35
36    Check (Test_Case_Index'Value (Argument (1)));
37 end Main;
```

6.6 List of Names

Goal: create a system for a list of names and ages.

Steps:

1. Implement the `Names_Ages` package.
    1. Declare the `People_Array` array type.
    2. Complete the declaration of the `People` record type with the `People_A` element of `People_Array` type.
    3. Implement the `Add` procedure.
    4. Implement the `Reset` procedure.
    5. Implement the `Get` function.
    6. Implement the `Update` procedure.
    7. Implement the `Display` procedure.

Requirements:

1. Each person is represented by the `Person` type, which is a record containing the name and the age of that person.
2. `People_Array` is an unconstrained array of `Person` type with a positive range.
3. The `Max_People` constant is set to 10.
4. Record type `People` contains:
    1. The `People_A` element of `People_Array` type.
    2. This array must be constrained by the `Max_People` constant.
5. Procedure `Add` adds a person to the list.
    1. By default, the age of this person is set to zero in this procedure.
6. Procedure `Reset` resets the list.
7. Function `Get` retrieves the age of a person from the list.
8. Procedure `Update` updates the age of a person in the list.
9. Procedure `Display` shows the complete list using the following format:
    1. The first line must be `LIST OF NAMES:`. It is followed by the name and age of each person in the next lines.
    2. For each person on the list, the procedure must display the information in the following format:

```
NAME: XXXX
AGE: YY
```

Remarks:

1. In the implementation of procedure Add, you may use an index to indicate the last valid position in the array — see Last_Valid in the code below.
2. In the implementation of procedure Display, you should use the Trim function from the Ada.Strings.Fixed package to format the person's name — for example: Trim (P.Name, Right).
3. You may need the Integer'Min (A, B) and the Integer'Max (A, B) functions to get the minimum and maximum values in a comparison between two integer values A and B.
4. Fixed-length strings can be initialized with whitespaces using the **others** syntax. For example: S : String_10 := (**others** => ' ');
5. You may implement additional subprograms to deal with other types declared in the Names_Ages package below, such as the Name_Type and the Person type.
    1. For example, a function To_Name_Type to convert from **String** to Name_Type might be useful.
    2. Take a moment to reflect on which additional subprograms could be useful as well.

Listing 16: names_ages.ads

```
1  package Names_Ages is
2
3     Max_People : constant Positive := 10;
4
5     subtype Name_Type is String (1 .. 50);
6
7     type Age_Type is new Natural;
8
9     type Person is record
10       Name  : Name_Type;
11       Age   : Age_Type;
12    end record;
13
14    --  Add type declaration for People_Array record:
15    --
16    --  type People_Array is ...;
17
18    --  Replace type declaration for People record. You may use the
19    --  following template:
20    --
21    --  type People is record
22    --     People_A   : People_Array ...;
23    --     Last_Valid : Natural;
24    --  end record;
25    --
26    type People is null record;
27
28    procedure Reset (P : in out People);
29

38       return;
39    elsif Argument_Count > 1 then
40       Ada.Text_IO.Put_Line ("Ignoring additional arguments...");
41    end if;
42
43    Check (Test_Case_Index'Value (Argument (1)));
44 end Main;
```

CHAPTER

SEVEN

MORE ABOUT TYPES

7.1 Aggregate Initialization

Goal: initialize records and arrays using aggregates.

Steps:

1. Implement the `Aggregates` package.
    1. Create the record type Rec.
    2. Create the array type `Int_Arr`.
    3. Implement the `Init` procedure that outputs a record of Rec type.
    4. Implement the `Init_Some` procedure.
    5. Implement the `Init` procedure that outputs an array of `Int_Arr` type.

Requirements:

1. Record type Rec has four components of **`Integer`** type. These are the components with the corresponding default values:
    - `W` = 10
    - `X` = 11
    - `Y` = 12
    - `Z` = 13
2. Array type `Int_Arr` has 20 elements of **`Integer`** type (with indices ranging from 1 to 20).
3. The first `Init` procedure outputs a record of Rec type where:
    1. `X` is initialized with 100,
    2. `Y` is initialized with 200, and
    3. the remaining elements use their default values.
4. Procedure `Init_Some` outputs an array of `Int_Arr` type where:
    1. the first five elements are initialized with the value 99, and
    2. the remaining elements are initialized with the value 100.
5. The second `Init` procedure outputs an array of `Int_Arr` type where:
    1. all elements are initialized with the value 5.

Listing 1: aggregates.ads

```
package Aggregates is

   --  type Rec is ...;

   --  type Int_Arr is ...;

   procedure Init;

   --  procedure Init_Some ...;

   --  procedure Init ...;

end Aggregates;
```

Listing 2: aggregates.adb

```
package body Aggregates is

   procedure Init is null;

end Aggregates;
```

Listing 3: main.adb

```
with Ada.Command_Line;  use Ada.Command_Line;
with Ada.Text_IO;       use Ada.Text_IO;

with Aggregates;        use Aggregates;

procedure Main is
   --  Remark: the following line is not relevant.
   F   : array (1 .. 10) of Float := (others => 42.42)
     with Unreferenced;

   type Test_Case_Index is
     (Default_Rec_Chk,
      Init_Rec_Chk,
      Init_Some_Arr_Chk,
      Init_Arr_Chk);

   procedure Check (TC : Test_Case_Index) is
      A : Int_Arr;
      R : Rec;
      DR : constant Rec := (others => <>);
   begin
      case TC is
         when Default_Rec_Chk =>
            R := DR;
            Put_Line ("Record Default:");
            Put_Line ("W => " & Integer'Image (R.W));
            Put_Line ("X => " & Integer'Image (R.X));
            Put_Line ("Y => " & Integer'Image (R.Y));
            Put_Line ("Z => " & Integer'Image (R.Z));
         when Init_Rec_Chk =>
            Init (R);
            Put_Line ("Record Init:");
            Put_Line ("W => " & Integer'Image (R.W));
            Put_Line ("X => " & Integer'Image (R.X));
            Put_Line ("Y => " & Integer'Image (R.Y));
```

(continues on next page)

(continued from previous page)

```
            Put_Line ("Z => " & Integer'Image (R.Z));
         when Init_Some_Arr_Chk =>
            Init_Some (A);
            Put_Line ("Array Init_Some:");
            for I in A'Range loop
               Put_Line (Integer'Image (I) & " "
                         & Integer'Image (A (I)));
            end loop;
         when Init_Arr_Chk =>
            Init (A);
            Put_Line ("Array Init:");
            for I in A'Range loop
               Put_Line (Integer'Image (I) & " "
                         & Integer'Image (A (I)));
            end loop;
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

7.2 Versioning

Goal: implement a simple package for source-code versioning.

Steps:

1. Implement the `Versioning` package.
    1. Declare the record type `Version`.
    2. Implement the `Convert` function that returns a string.
    3. Implement the `Convert` function that returns a floating-point number.

Requirements:

1. Record type `Version` has the following components of **`Natural`** type:
    1. `Major`,
    2. `Minor`, and
    3. `Maintenance`.
2. The first `Convert` function returns a string containing the version number.
3. The second `Convert` function returns a floating-point value.
    1. For this floating-point value:
        1. the number before the decimal point must correspond to the major number, and
        2. the number after the decimal point must correspond to the minor number.

3. the maintenance number is ignored.

2. For example, version "1.3.5" is converted to the floating-point value `1.3`.
3. An obvious limitation of this function is that it can only handle one-digit numbers for the minor component.
   - For example, we cannot convert version "1.10.0" to a reasonable value with the approach described above. The result of the call `Convert ((1, 10, 0))` is therefore unspecified.
   - For the scope of this exercise, only version numbers with one-digit components are checked.

Remarks:

1. We use overloading for the `Convert` functions.
2. For the function `Convert` that returns a string, you can make use of the `Image_Trim` function, as indicated in the source-code below — see package body of `Versioning`.

Listing 4: versioning.ads

```
package Versioning is

   --  type Version is record...

   --  function Convert ...

   --  function Convert

end Versioning;
```

Listing 5: versioning.adb

```
with Ada.Strings; use Ada.Strings;
with Ada.Strings.Fixed; use Ada.Strings.Fixed;

package body Versioning is

   function Image_Trim (N : Natural) return String is
      S_N : constant String := Trim (Natural'Image (N), Left);
   begin
      return S_N;
   end Image_Trim;

   --  function Convert ...
   --     S_Major : constant String := Image_Trim (V.Major);
   --     S_Minor : constant String := Image_Trim (V.Minor);
   --     S_Maint : constant String := Image_Trim (V.Maintenance);
   --  begin
   --  end Convert;

   --  function Convert ...
   --  begin
   --  end Convert;

end Versioning;
```

Listing 6: main.adb

```
with Ada.Command_Line;  use Ada.Command_Line;
with Ada.Text_IO;       use Ada.Text_IO;

```

(continues on next page)

(continued from previous page)

```
with Versioning;        use Versioning;

procedure Main is
   type Test_Case_Index is
     (Ver_String_Chk,
      Ver_Float_Chk);

   procedure Check (TC : Test_Case_Index) is
      V : constant Version := (1, 3, 23);
   begin
      case TC is
         when Ver_String_Chk =>
            Put_Line (Convert (V));
         when Ver_Float_Chk =>
            Put_Line (Float'Image (Convert (V)));
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

7.3 Simple todo list

Goal: implement a simple to-do list system.

Steps:

1. Implement the `Todo_Lists` package.
    1. Declare the `Todo_Item` type.
    2. Declare the `Todo_List` type.
    3. Implement the `Add` procedure.
    4. Implement the `Display` procedure.

Requirements:

1. `Todo_Item` type is used to store a to-do item.
    1. It should be implemented as an access type to strings.
2. `Todo_Items` type is an array of to-do items.
    1. It should be implemented as an unconstrained array with positive range.
3. `Todo_List` type is the container for all to-do items.
    1. This record type must have a discriminant for the maximum number of elements of the list.
    2. In order to store the to-do items, it must contain a component named `Items` of `Todo_Items` type.
    3. Don't forget to keep track of the last element added to the list!

- You should declare a `Last` component in the record.

4. Procedure `Add` adds items (of `Todo_Item` type) to the list (of `Todo_List` type).
    1. This requires allocating a string for the access type.
    2. An item can only be added to the list if the list isn't full yet — see next point for details on error handling.
5. Since the number of items that can be stored on the list is limited, the list might eventually become full in a call to `Add`.
    1. You must write code in the implementation of the `Add` procedure that verifies this condition.
    2. If the procedure detects that the list is full, it must display the following message: "ERROR: list is full!".
6. Procedure `Display` is used to display all to-do items.
    1. The header (first line) must be `TO-DO LIST`.
    2. It must display one item per line.

Remarks:

1. We use access types and unconstrained arrays in the implementation of the `Todo_Lists` package.

Listing 7: todo_lists.ads

```
package Todo_Lists is

   --  Replace by actual type declaration
   type Todo_Item is null record;

   --  Replace by actual type declaration
   type Todo_Items is null record;

   --  Replace by actual type declaration
   type Todo_List is null record;

   procedure Add (Todos : in out Todo_List;
                  Item  : String);

   procedure Display (Todos : Todo_List);

end Todo_Lists;
```

Listing 8: todo_lists.adb

```
with Ada.Text_IO; use Ada.Text_IO;

package body Todo_Lists is

   procedure Add (Todos : in out Todo_List;
                  Item  : String) is
   begin
      Put_Line ("ERROR: list is full!");
   end Add;

   procedure Display (Todos : Todo_List) is
   begin
      null;
   end Display;
```

(continues on next page)

(continued from previous page)

```
15
16 end Todo_Lists;
```

Listing 9: main.adb

```
1  with Ada.Command_Line;  use Ada.Command_Line;
2  with Ada.Text_IO;       use Ada.Text_IO;
3
4  with Todo_Lists;        use Todo_Lists;
5
6  procedure Main is
7     type Test_Case_Index is
8       (Todo_List_Chk);
9
10    procedure Check (TC : Test_Case_Index) is
11       T : Todo_List (10);
12    begin
13       case TC is
14          when Todo_List_Chk =>
15             Add (T, "Buy milk");
16             Add (T, "Buy tea");
17             Add (T, "Buy present");
18             Add (T, "Buy tickets");
19             Add (T, "Pay electricity bill");
20             Add (T, "Schedule dentist appointment");
21             Add (T, "Call sister");
22             Add (T, "Revise spreasheet");
23             Add (T, "Edit entry page");
24             Add (T, "Select new design");
25             Add (T, "Create upgrade plan");
26             Display (T);
27       end case;
28    end Check;
29
30 begin
31    if Argument_Count < 1 then
32       Put_Line ("ERROR: missing arguments! Exiting...");
33       return;
34    elsif Argument_Count > 1 then
35       Put_Line ("Ignoring additional arguments...");
36    end if;
37
38    Check (Test_Case_Index'Value (Argument (1)));
39 end Main;
```

7.4 Price list

Goal: implement a list containing prices

Steps:

1. Implement the `Price_Lists` package.
    1. Declare the `Price_Type` type.
    2. Declare the `Price_List` record.
    3. Implement the `Reset` procedure.
    4. Implement the `Add` procedure.

5. Implement the `Get` function.
6. Implement the `Display` procedure.

Requirements:

1. `Price_Type` is a decimal fixed-point data type with a delta of two digits (e.g. `0.01`) and twelve digits in total.
2. `Price_List` is a record type that contains the price list.
    1. This record type must have a discriminant for the maximum number of elements of the list.
3. Procedure `Reset` resets the list.
4. Procedure `Add` adds a price to the list.
    1. You should keep track of the last element added to the list.
5. Function `Get` retrieves a price from the list using an index.
    1. This function returns a record instance of `Price_Result` type.
    2. `Price_Result` is a variant record containing:
        1. the Boolean component `Ok`, and
        2. the component `Price` (of `Price_Type`).
    3. The returned value of `Price_Result` type is one of the following:
        1. If the index specified in a call to `Get` contains a valid (initialized) price, then
            - `Ok` is set to **`True`**, and
            - the `Price` component contains the price for that index.
        2. Otherwise:
            - `Ok` is set to **`False`**, and
            - the `Price` component is not available.
6. Procedure `Display` shows all prices from the list.
    1. The header (first line) must be `PRICE LIST`.
    2. The remaining lines contain one price per line.
    3. For example:
        - For the following code:

```
procedure Test is
   L : Price_List (10);
begin
   Reset (L);
   Add (L, 1.45);
   Add (L, 2.37);
   Display (L);
end Test;
```

        - The output is:

```
PRICE LIST
 1.45
 2.37
```

Remarks:

1. To implement the package, you'll use the following features of the Ada language:

1. decimal fixed-point types;
2. records with discriminants;
3. dynamically-sized record types;
4. variant records.

2. For record type `Price_List`, you may use an unconstrained array as a component of the record and use the discriminant in the component declaration.

Listing 10: price_lists.ads

```
package Price_Lists is

   --  Replace by actual type declaration
   type Price_Type is new Float;

   --  Replace by actual type declaration
   type Price_List is null record;

   --  Replace by actual type declaration
   type Price_Result is null record;

   procedure Reset (Prices : in out Price_List);

   procedure Add (Prices : in out Price_List;
                  Item   : Price_Type);

   function Get (Prices : Price_List;
                 Idx    : Positive) return Price_Result;

   procedure Display (Prices : Price_List);

end Price_Lists;
```

Listing 11: price_lists.adb

```
package body Price_Lists is

   procedure Reset (Prices : in out Price_List) is
   begin
      null;
   end Reset;

   procedure Add (Prices : in out Price_List;
                  Item   : Price_Type) is
   begin
      null;
   end Add;

   function Get (Prices : Price_List;
                 Idx    : Positive) return Price_Result is
   begin
      null;
   end Get;

   procedure Display (Prices : Price_List) is
   begin
      null;
   end Display;

end Price_Lists;
```

Listing 12: main.adb

```
with Ada.Command_Line;  use Ada.Command_Line;
with Ada.Text_IO;       use Ada.Text_IO;

with Price_Lists;       use Price_Lists;

procedure Main is
   type Test_Case_Index is
     (Price_Type_Chk,
      Price_List_Chk,
      Price_List_Get_Chk);

   procedure Check (TC : Test_Case_Index) is
      L : Price_List (10);

      procedure Local_Init_List is
      begin
         Reset (L);
         Add (L, 1.45);
         Add (L, 2.37);
         Add (L, 3.21);
         Add (L, 4.14);
         Add (L, 5.22);
         Add (L, 6.69);

CHAPTER

EIGHT

PRIVACY

8.1 Directions

Goal: create a package that handles directions and geometric angles using a previous implementation.

Steps:

1. Fix the implementation of the `Test_Directions` procedure.

Requirements:

1. The implementation of the `Test_Directions` procedure must compile correctly.

Remarks:

1. This exercise is based on the *Directions* exercise from the *Records* (page 33) labs.
    1. In this version, however, `Ext_Angle` is a private type.
2. In the implementation of the `Test_Directions` procedure below, the Ada developer tried to initialize `All_Directions` — an array of `Ext_Angle` type — with aggregates.
    1. Since we now have a private type, the compiler complains about this initialization.
3. To fix the implementation of the `Test_Directions` procedure, you should use the appropriate function from the `Directions` package.
4. The initialization of `All_Directions` in the code below contains a consistency error where the angle doesn't match the assessed direction.
    1. See if you can spot this error!
    2. This kind of errors can happen when record components that have correlated information are initialized individually without consistency checks — using private types helps to avoid the problem by requiring initialization routines that can enforce consistency.

Listing 1: directions.ads

```
1  package Directions is
2
3     type Angle_Mod is mod 360;
4
5     type Direction is
6       (North,
7        Northwest,
8        West,
9        Southwest,
10       South,
11       Southeast,
12       East);
```

(continues on next page)

(continued from previous page)

```
13
14    function To_Direction (N : Angle_Mod) return Direction;
15
16    type Ext_Angle is private;
17
18    function To_Ext_Angle (N : Angle_Mod) return Ext_Angle;
19
20    procedure Display (N : Ext_Angle);
21
22 private
23
24    type Ext_Angle is record
25       Angle_Elem     : Angle_Mod;
26       Direction_Elem : Direction;
27    end record;
28
29 end Directions;
```

Listing 2: directions.adb

```

2
3  package body Directions is
4
5     procedure Display (N : Ext_Angle) is
6     begin
7        Put_Line ("Angle: "
8                  & Angle_Mod'Image (N.Angle_Elem)
9                  & " => "
10                 & Direction'Image (N.Direction_Elem)
11                 & ".");
12    end Display;
13
14    function To_Direction (N : Angle_Mod) return Direction is
15    begin
16       case N is
17          when   0        => return East;
18          when   1 ..  89 => return Northwest;
19          when  90        => return North;
20          when  91 .. 179 => return Northwest;
21          when 180        => return West;
22          when 181 .. 269 => return Southwest;
23          when 270        => return South;
24          when 271 .. 359 => return Southeast;
25       end case;
26    end To_Direction;
27
28    function To_Ext_Angle (N : Angle_Mod) return Ext_Angle is
29    begin
30       return (Angle_Elem     => N,
31               Direction_Elem => To_Direction (N));
32    end To_Ext_Angle;
33
34 end Directions;
```

Listing 3: test_directions.adb

```
1  with Directions; use Directions;
2
3  procedure Test_Directions is
```

(continues on next page)

(continued from previous page)

```
   type Ext_Angle_Array is array (Positive range <>) of Ext_Angle;

   All_Directions : constant Ext_Angle_Array (1 .. 6)
     := ((0,   East),
         (45,  Northwest),
         (90,  North),
         (91,  North),
         (180, West),
         (270, South));

begin
   for I in All_Directions'Range loop
      Display (All_Directions (I));
   end loop;

end Test_Directions;
```

Listing 4: main.adb

```
with Ada.Command_Line;  use Ada.Command_Line;
with Ada.Text_IO;       use Ada.Text_IO;

with Test_Directions;

procedure Main is
     type Test_Case_Index is
     (Direction_Chk);

   procedure Check (TC : Test_Case_Index) is
   begin
      case TC is
      when Direction_Chk =>
         Test_Directions;
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

8.2 Limited Strings

Goal: work with `limited private` types.

Steps:

1. Implement the `Limited_Strings` package.
    1. Implement the `Copy` function.
    2. Implement the `=` operator.

Requirements:

1. For both `Copy` and `=`, the two parameters may refer to strings with different lengths. We'll limit the implementation to just take the minimum length:
    1. In case of copying the string "Hello World" to a string with 5 characters, the copied string is "Hello":

```
   S1 : constant Lim_String := Init ("Hello World");
   S2 :          Lim_String := Init (5);
begin
   Copy (From => S1, To => S2);
   Put_Line (S2);     --  This displays "Hello".
```

    2. When comparing "Hello World" to "Hello", the `=` operator indicates that these strings are equivalent:

```
   S1 : constant Lim_String := Init ("Hello World");
   S2 : constant Lim_String := Init ("Hello");
begin
   if S1 = S2 then
      --  True => This branch gets selected.
```

2. When copying from a short string to a longer string, the remaining characters of the longer string must be initialized with underscores (_). For example:

```
   S1 : constant Lim_String := Init ("Hello");
   S2 :          Lim_String := Init (10);
begin
   Copy (From => S1, To => S2);
   Put_Line (S2);     --  This displays "Hello_____".
```

Remarks:

1. As we've discussed in the course:
    1. Variables of limited types have the following limitations:
        - they cannot be assigned to;
        - they don't have an equality operator (=).
    2. We can, however, define our own, custom subprograms to circumvent these limitations:
        - In order to copy instances of a limited type, we can define a custom `Copy` procedure.
        - In order to compare instances of a limited type, we can define an `=` operator.
2. You can use the `Min_Last` constant — which is already declared in the implementation of these subprograms — in the code you write.
3. Some details about the `Limited_Strings` package:
    1. The `Lim_String` type acts as a container for strings.
        1. In the the private part, `Lim_String` is declared as an access type to a **`String`**.
    2. There are two versions of the `Init` function that initializes an object of `Lim_String` type:
        1. The first one takes another string.
        2. The second one receives the number of characters for a string *container*.
    3. Procedure `Put_Line` displays object of `Lim_String` type.
    4. The design and implementation of the `Limited_Strings` package is very simplistic.

1. A good design would have better handling of access types, for example.

Listing 5: limited_strings.ads

```
package Limited_Strings is

   type Lim_String is limited private;

   function Init (S : String) return Lim_String;

   function Init (Max : Positive) return Lim_String;

   procedure Put_Line (LS : Lim_String);

   procedure Copy (From :        Lim_String;
                   To   : in out Lim_String);

   function "=" (Ref, Dut : Lim_String) return Boolean;

private

   type Lim_String is access String;

end Limited_Strings;
```

Listing 6: limited_strings.adb

```
with Ada.Text_IO;

package body Limited_Strings
is

   function Init (S : String) return Lim_String is
      LS : constant Lim_String := new String'(S);
   begin
      return Ls;
   end Init;

   function Init (Max : Positive) return Lim_String is
      LS : constant Lim_String := new String (1 .. Max);
   begin
      LS.all := (others => '_');
      return LS;
   end Init;

   procedure Put_Line (LS : Lim_String) is
   begin
      Ada.Text_IO.Put_Line (LS.all);
   end Put_Line;

   function Get_Min_Last (A, B : Lim_String) return Positive is
   begin
      return Positive'Min (A'Last, B'Last);
   end Get_Min_Last;

   procedure Copy (From :        Lim_String;
                   To   : in out Lim_String) is
      Min_Last : constant Positive := Get_Min_Last (From, To);
   begin
      --  Complete the implementation!
      null;
   end;
```

(continues on next page)

   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

8.3 Bonus exercise

In previous labs, we had many source-code snippets containing records that could be declared private. The source-code for the exercise above (*Directions*) is an example: we've modified the type declaration of `Ext_Angle`, so that the record is now private. Encapsulating the record components — by declaring record components in the private part — makes the code safer. Also, because many of the code snippets weren't making use of record components directly (but handling record types via the API instead), they continue to work fine after these modifications.

This exercise doesn't contain any source-code. In fact, the **goal** here is to modify previous labs, so that the record declarations are made private. You can look into those labs, modify the type declarations, and recompile the code. The corresponding test-cases must still pass.

If no other changes are needed apart from changes in the declaration, then that indicates we have used good programming techniques in the original code. On the other hand, if further changes are needed, then you should investigate why this is the case.

Also note that, in some cases, you can move support types into the private part of the specification without affecting its compilation. This is the case, for example, for the `People_Array` type of the *List of Names* lab mentioned below. You should, in fact, keep only relevant types and subprograms in the public part and move all support declarations to the private part of the specification whenever possible.

Below, you find the selected labs that you can work on, including changes that you should make. In case you don't have a working version of the source-code of previous labs, you can look into the corresponding solutions.

8.3.1 Colors

Chapter: *Records* (page 33)

Steps:

1. Change declaration of RGB type to **`private`**.

Requirements:

1. Implementation must compile correctly and test cases must pass.

8.3.2 List of Names

Chapter: *Arrays* (page 43)

Steps:

1. Change declaration of `Person` and `People` types to **`limited private`**.
2. Move type declaration of `People_Array` to private part.

Requirements:

1. Implementation must compile correctly and test cases must pass.

8.3.3 Price List

Chapter: *More About Types* (page 61)

Steps:

1. Change declaration of `Price_List` type to **`limited private`**.

Requirements:

1. Implementation must compile correctly and test cases must pass.

CHAPTER

NINE

GENERICS

9.1 Display Array

Goal: create a generic procedure that displays the elements of an array.

Steps:

1. Implement the generic procedure `Display_Array`.

Requirements:

1. Generic procedure `Display_Array` displays the elements of an array.
    1. It uses the following scheme:
        - First, it displays a header.
        - Then, it displays the elements of the array.
    2. When displaying the elements, it must:
        - use one line per element, and
        - include the corresponding index of the array.
    3. This is the expected format:

```
<HEADER>
<index #1>: <element #1>
<index #2>: <element #2>
...
```

    4. For example:
        - For the following code:

```
procedure Test is
   A : Int_Array (1 .. 2) := (1, 5);
begin
   Display_Int_Array ("Elements of A", A);;
end Test;
```

        - The output is:

```
Elements of A
 1:  1
 2:  5
```

2. These are the formal parameters of the procedure:
    1. a range type `T_Range` for the the array;
    2. a formal type `T_Element` for the elements of the array;

- This type must be declared in such a way that it can be mapped to any type in the instantiation — including record types.

3. an array type `T_Array` using the `T_Range` and `T_Element` types;
4. a function `Image` that converts a variable of `T_Element` type to a **`String`**.

Listing 1: display_array.ads

```
generic
procedure Display_Array (Header : String;
                         A      : T_Array);
```

Listing 2: display_array.adb

```
with Ada.Text_IO; use Ada.Text_IO;

procedure Display_Array (Header : String;
                         A      : T_Array) is
begin
   null;
end Display_Array;
```

Listing 3: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Display_Array;

procedure Main is
   type Test_Case_Index is (Int_Array_Chk,
                            Point_Array_Chk);

   procedure Test_Int_Array is
      type Int_Array is array (Positive range <>) of Integer;

      procedure Display_Int_Array is new
        Display_Array (T_Range => Positive,
                       T_Element => Integer,
                       T_Array   => Int_Array,
                       Image     => Integer'Image);

      A : constant Int_Array (1 .. 5) := (1, 2, 5, 7, 10);
   begin
      Display_Int_Array ("Integers", A);
   end Test_Int_Array;

   procedure Test_Point_Array is
      type Point is record
         X : Float;
         Y : Float;
      end record;

      type Point_Array is array (Natural range <>) of Point;

      function Image (P : Point) return String is
      begin
         return "(" & Float'Image (P.X)
           & ", " & Float'Image (P.Y) & ")";
      end Image;

```

(continues on next page)

(continued from previous page)

```
38       procedure Display_Point_Array is new
39         Display_Array (T_Range   => Natural,
40                        T_Element => Point,
41                        T_Array   => Point_Array,
42                        Image     => Image);
43
44       A : constant Point_Array (0 .. 3) := ((1.0, 0.5), (2.0, -0.5),
45                                             (5.0, 2.0), (-0.5, 2.0));
46    begin
47       Display_Point_Array ("Points", A);
48    end Test_Point_Array;
49
50    procedure Check (TC : Test_Case_Index) is
51    begin
52       case TC is
53          when Int_Array_Chk =>
54             Test_Int_Array;
55          when Point_Array_Chk =>
56             Test_Point_Array;
57       end case;
58    end Check;
59
60 begin
61    if Argument_Count < 1 then
62       Put_Line ("ERROR: missing arguments! Exiting...");
63       return;
64    elsif Argument_Count > 1 then
65       Put_Line ("Ignoring additional arguments...");
66    end if;
67
68    Check (Test_Case_Index'Value (Argument (1)));
69 end Main;
```

9.2 Average of Array of Float

Goal: create a generic function that calculates the average of an array of floating-point elements.

Steps:

1. Declare and implement the generic function `Average`.

Requirements:

1. Generic function `Average` calculates the average of an array containing floating-point values of arbitrary precision.
2. Generic function `Average` must contain the following formal parameters:
    1. a range type `T_Range` for the array;
    2. a formal type `T_Element` that can be mapped to floating-point types of arbitrary precision;
    3. an array type `T_Array` using `T_Range` and `T_Element`;

Remarks:

1. You should use the **`Float`** type for the accumulator.

Listing 4: average.ads

```
generic
function Average (A : T_Array) return T_Element;
```

Listing 5: average.adb

```
function Average (A : T_Array) return T_Element is
begin
   return 0.0;
end Average;
```

Listing 6: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;

9.3 Average of Array of Any Type

Goal: create a generic function that calculates the average of an array of elements of any arbitrary type.

Steps:

1. Declare and implement the generic function `Average`.
2. Implement the test procedure `Test_Item`.
    1. Declare the `F_IO` package.
    2. Implement the `Get_Total` function for the `Item` type.
    3. Implement the `Get_Price` function for the `Item` type.
    4. Declare the `Average_Total` function.
    5. Declare the `Average_Price` function.

Requirements:

1. Generic function `Average` calculates the average of an array containing elements of any arbitrary type.
2. Generic function `Average` has the same formal parameters as in the previous exercise, except for:
    1. `T_Element`, which is now a formal type that can be mapped to any arbitrary type.
    2. `To_Float`, which is an *additional* formal parameter.
        - `To_Float` is a function that converts the arbitrary element of `T_Element` type to the **`Float`** type.
3. Procedure `Test_Item` is used to test the generic `Average` procedure for a record type (`Item`).
    1. Record type `Item` contains the `Quantity` and `Price` components.
4. The following functions have to implemented to be used for the formal `To_Float` function parameter:
    1. For the `Decimal` type, the function is pretty straightforward: it simply returns the floating-point value converted from the decimal type.
    2. For the `Item` type, two functions must be created to convert to floating-point type:
        1. `Get_Total`, which returns the multiplication of the quantity and the price components of the `Item` type;
        2. `Get_Price`, which returns just the price.

5. The generic function `Average` must be instantiated as follows:
    1. For the `Item` type, you must:
        1. declare the `Average_Total` function (as an instance of `Average`) using the `Get_Total` for the `To_Float` parameter;
        2. declare the `Average_Price` function (as an instance of `Average`) using the `Get_Price` for the `To_Float` parameter.
6. You must use the `Put` procedure from `Ada.Text_IO.Float_IO`.
    1. The generic standard package `Ada.Text_IO.Float_IO` must be instantiated as `F_IO` in the test procedures.
    2. This is the specification of the `Put` procedure, as described in the appendix A.10.9 of the Ada Reference Manual:

```
procedure Put(Item : in Num;
              Fore : in Field := Default_Fore;
              Aft  : in Field := Default_Aft;
              Exp  : in Field := Default_Exp);
```

    3. This is the expected format when calling `Put` from `Float_IO`:

Function	Fore	Aft	Exp
Test_Item	3	2	0

Remarks:

1. In this exercise, you'll abstract the `Average` function from the previous exercises a step further.
    1. In this case, the function shall be able to calculate the average of any arbitrary type — including arrays containing elements of record types.
    2. Since record types can be composed by many components of different types, we need to provide a way to indicate which component (or components) of the record will be used when calculating the average of the array.
    3. This problem is solved by specifying a `To_Float` function as a formal parameter, which converts the arbitrary element of `T_Element` type to the **`Float`** type.
    4. In the implementation of the `Average` function, we use the `To_Float` function and calculate the average using a floating-point variable.

Listing 7: average.ads

```
generic
function Average (A : T_Array) return Float;
```

Listing 8: average.adb

```
function Average (A : T_Array) return Float is
begin
   null;
end Average;
```

Listing 9: test_item.ads

```
procedure Test_Item;
```

Listing 10: test_item.adb

```
with Ada.Text_IO;      use Ada.Text_IO;

with Average;

procedure Test_Item is
   type Amount is delta 0.01 digits 12;

   type Item is record
      Quantity : Natural;
      Price    : Amount;
   end record;

   type Item_Array is
     array (Positive range <>) of Item;

   A : constant Item_Array (1 .. 4)
     := ((Quantity =>  5,   Price => 10.00),
         (Quantity => 80,   Price =>  2.50),
         (Quantity => 40,   Price =>  5.00),
         (Quantity => 20,   Price => 12.50));

begin
   Put ("Average per item & quantity: ");
   F_IO.Put (Average_Total (A));
   New_Line;

   Put ("Average price:               ");
   F_IO.Put (Average_Price (A));
   New_Line;
end Test_Item;
```

Listing 11: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Test_Item;

procedure Main is
   type Test_Case_Index is (Item_Array_Chk);

   procedure Check (TC : Test_Case_Index) is
   begin
      case TC is
         when Item_Array_Chk =>
            Test_Item;
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

9.4 Generic list

Goal: create a system based on a generic list to add and displays elements.

Steps:

1. Declare and implement the generic package `Gen_List`.
    1. Implement the `Init` procedure.
    2. Implement the `Add` procedure.
    3. Implement the `Display` procedure.

Requirements:

1. Generic package `Gen_List` must have the following subprograms:
    1. Procedure `Init` initializes the list.
    2. Procedure `Add` adds an item to the list.
        1. This procedure must contain a `Status` output parameter that is set to **`False`** when the list was full — i.e. if the procedure failed while trying to add the item;
    3. Procedure `Display` displays the complete list.
        1. This includes the *name* of the list and its elements — using one line per element.
        2. This is the expected format:

```
<NAME>
<element #1>
<element #2>
...
```

2. Generic package `Gen_List` has these formal parameters:
    1. an arbitrary formal type `Item`;
    2. an unconstrained array type `Items` of `Item` element with positive range;
    3. the `Name` parameter containing the name of the list;
        - This must be a formal input object of **`String`** type.
        - It must be used in the `Display` procedure.
    4. an actual array `List_Array` to store the list;
        - This must be a formal **`in out`** object of `Items` type.
    5. the variable `Last` to store the index of the last element;
        - This must be a formal **`in out`** object of **`Natural`** type.
    6. a procedure `Put` for the `Item` type.
        - This procedure is used in the `Display` procedure to display individual elements of the list.
3. The test procedure `Test_Int` is used to test a list of elements of **`Integer`** type.
4. For both test procedures, you must:
    1. add missing type declarations;
    2. declare and implement a `Put` procedure for individual elements of the list;
    3. declare instances of the `Gen_List` package.
        - For the `Test_Int` procedure, declare the `Int_List` package.

Remarks:

1. In previous labs, you've been implementing lists for a variety of types.
   - The *List of Names* exercise from the *Arrays* (page 43) labs is an example.
   - In this exercise, you have to abstract those implementations to create the generic `Gen_List` package.

Listing 12: gen_list.ads

```
generic
package Gen_List is

   procedure Init;

   procedure Add (I      :     Item;
                  Status : out Boolean);

   procedure Display;

end Gen_List;
```

Listing 13: gen_list.adb

```
with Ada.Text_IO; use Ada.Text_IO;

package body Gen_List is

   procedure Init is
   begin
      null;
   end Init;

   procedure Add (I      :     Item;
                  Status : out Boolean) is
   begin
      null;
   end Add;

   procedure Display is
   begin
      null;
   end Display;

end Gen_List;
```

Listing 14: test_int.ads

```
procedure Test_Int;
```

Listing 15: test_int.adb

```
with Ada.Text_IO; use Ada.Text_IO;

with Gen_List;

procedure Test_Int is

   type Integer_Array is array (Positive range <>) of Integer;

   A : Integer_Array (1 .. 3);
```

(continues on next page)

(continued from previous page)

```
   L : Natural;

   Success : Boolean;

   procedure Display_Add_Success (Success : Boolean) is
   begin
      if Success then
         Put_Line ("Added item successfully!");
      else
         Put_Line ("Couldn't add item!");
      end if;

   end Display_Add_Success;

begin
   Int_List.Init;

   Int_List.Add (2, Success);
   Display_Add_Success (Success);

   Int_List.Add (5, Success);
   Display_Add_Success (Success);

   Int_List.Add (7, Success);
   Display_Add_Success (Success);

   Int_List.Add (8, Success);
   Display_Add_Success (Success);

   Int_List.Display;
end Test_Int;
```

Listing 16: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Test_Int;

procedure Main is
   type Test_Case_Index is (Int_Chk);

   procedure Check (TC : Test_Case_Index) is
   begin
      case TC is
         when Int_Chk =>
            Test_Int;
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

CHAPTER

TEN

EXCEPTIONS

10.1 Uninitialized Value

Goal: implement an enumeration to avoid the use of uninitialized values.

Steps:

1. Implement the `Options` package.
    1. Declare the `Option` enumeration type.
    2. Declare the `Uninitialized_Value` exception.
    3. Implement the `Image` function.

Requirements:

1. Enumeration `Option` contains:
    1. the `Uninitialized` value, and
    2. the actual options:
        - `Option_1`,
        - `Option_2`,
        - `Option_3`.
2. Function `Image` returns a string for the `Option` type.
    1. In case the argument to `Image` is `Uninitialized`, the function must raise the `Uninitialized_Value` exception.

Remarks:

1. In this exercise, we employ exceptions as a mechanism to avoid the use of uninitialized values for a certain type.

Listing 1: options.ads

```
package Options is

   --  Declare the Option enumeration type!
   type Option is null record;

   function Image (O : Option) return String;

end Options;
```

Listing 2: options.adb

```
package body Options is

   function Image (O : Option) return String is
   begin
      return "";
   end Image;

end Options;
```

Listing 3: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;
with Ada.Exceptions;   use Ada.Exceptions;

with Options;          use Options;

procedure Main is
   type Test_Case_Index is
     (Options_Chk);

   procedure Check (TC : Test_Case_Index) is

      procedure Check (O : Option) is
      begin
         Put_Line (Image (O));
      exception
         when E : Uninitialized_Value =>
            Put_Line (Exception_Message (E));
      end Check;

   begin
      case TC is
      when Options_Chk =>
         for O in Option loop
            Check (O);
         end loop;
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

10.2 Numerical Exception

Goal: handle numerical exceptions in a test procedure.

Steps:

1. Add exception handling to the `Check_Exception` procedure.

Requirements:

1. The test procedure `Num_Exception_Test` from the `Tests` package below must be used in the implementation of `Check_Exception`.
2. The `Check_Exception` procedure must be extended to handle exceptions as follows:
    1. If the exception raised by `Num_Exception_Test` is `Constraint_Error`, the procedure must display the message "Constraint_Error detected!" to the user.
    2. Otherwise, it must display the message associated with the exception.

Remarks:

1. You can use the `Exception_Message` function to retrieve the message associated with an exception.

Listing 4: tests.ads

```
package Tests is

   type Test_ID is (Test_1, Test_2);

   Custom_Exception : exception;

   procedure Num_Exception_Test (ID : Test_ID);

end Tests;
```

Listing 5: tests.adb

```
package body Tests is

   pragma Warnings (Off, "variable ""C"" is assigned but never read");

   procedure Num_Exception_Test (ID : Test_ID) is
      A, B, C : Integer;
   begin
      case ID is
         when Test_1 =>
            A := Integer'Last;
            B := Integer'Last;
            C := A + B;
         when Test_2 =>
            raise Custom_Exception with "Custom_Exception raised!";
      end case;
   end Num_Exception_Test;

   pragma Warnings (On, "variable ""C"" is assigned but never read");

end Tests;
```

Listing 6: check_exception.adb

```
with Tests; use Tests;

```

(continues on next page)

(continued from previous page)

```
procedure Check_Exception (ID : Test_ID) is
begin
   Num_Exception_Test (ID);
end Check_Exception;
```

Listing 7: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;
with Ada.Exceptions;   use Ada.Exceptions;

with Tests;            use Tests;
with Check_Exception;

procedure Main is
   type Test_Case_Index is
     (Exception_1_Chk,
      Exception_2_Chk);

   procedure Check (TC : Test_Case_Index) is

      procedure Check_Handle_Exception (ID : Test_ID) is
      begin
         Check_Exception (ID);
      exception
         when Constraint_Error =>
            Put_Line ("Constraint_Error"
                      & " (raised by Check_Exception) detected!");
         when E : others =>
            Put_Line (Exception_Name (E)
                      & " (raised by Check_Exception) detected!");
      end Check_Handle_Exception;

   begin
      case TC is
      when Exception_1_Chk =>
         Check_Handle_Exception (Test_1);
      when Exception_2_Chk =>
         Check_Handle_Exception (Test_2);
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

10.3 Re-raising Exceptions

Goal: make use of exception re-raising in a test procedure.

Steps:

1. Declare new exception: `Another_Exception`.
2. Add exception re-raise to the `Check_Exception` procedure.

Requirements:

1. Exception `Another_Exception` must be declared in the `Tests` package.
2. Procedure `Check_Exception` must be extended to *re-raise* any exception. When an exception is detected, the procedure must:
    1. display a user message (as implemented in the previous exercise), and then
    2. Raise or *re-raise* exception depending on the exception that is being handled:
        1. In case of `Constraint_Error` exception, *re-raise* the exception.
        2. In all other cases, raise `Another_Exception`.

Remarks:

1. In this exercise, you should extend the implementation of the `Check_Exception` procedure from the previous exercise.
    1. Naturally, you can use the code for the `Check_Exception` procedure from the previous exercise as a starting point.

Listing 8: tests.ads

```

2
3     pragma Warnings (Off, "variable ""C"" is assigned but never read");
4
5     procedure Num_Exception_Test (ID : Test_ID) is
6        A, B, C : Integer;
7     begin
8        case ID is
9           when Test_1 =>
10             A := Integer'Last;
11             B := Integer'Last;
12             C := A + B;
13          when Test_2 =>
14             raise Custom_Exception with "Custom_Exception raised!";
15       end case;
16    end Num_Exception_Test;
17
18    pragma Warnings (On, "variable ""C"" is assigned but never read");

```

CHAPTER

ELEVEN

TASKING

11.1 Display Service

Goal: create a simple service that displays messages to the user.

Steps:

1. Implement the `Display_Services` package.
    1. Declare the task type `Display_Service`.
    2. Implement the `Display` entry for strings.
    3. Implement the `Display` entry for integers.

Requirements:

1. Task type `Display_Service` uses the `Display` entry to display messages to the user.
2. There are two versions of the `Display` entry:
    1. One that receives messages as a string parameter.
    2. One that receives messages as an **`Integer`** parameter.
3. When a message is received via a `Display` entry, it must be displayed immediately to the user.

Listing 1: display_services.ads

```
package Display_Services is

end Display_Services;
```

      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

11.2 Event Manager

Goal: implement a simple event manager.

Steps:

1. Implement the `Event_Managers` package.
    1. Declare the task type `Event_Manager`.
    2. Implement the `Start` entry.
    3. Implement the `Event` entry.

Requirements:

1. The event manager has a similar behavior as an alarm
    1. The sole purpose of this event manager is to display the event ID at the correct time.
    2. After the event ID is displayed, the task must finish.
2. The event manager (`Event_Manager` type) must have two entries:
    1. `Start`, which starts the event manager with an event ID;
    2. `Event`, which delays the task until a certain time and then displays the event ID as a user message.
3. The format of the user message displayed by the event manager is `Event #<event_id>`.
    1. You should use `Natural'Image` to display the ID (as indicated in the body of the `Event_Managers` package below).

Remarks:

1. In the `Start` entry, you can use the **`Natural`** type for the ID.

2. In the Event entry, you should use the Time type from the Ada.Real_Time package for the time parameter.
3. Note that the test application below creates an array of event managers with different delays.

Listing 4: event_managers.ads

```
package Event_Managers is

end Event_Managers;
```

Listing 5: event_managers.adb

```
package body Event_Managers is

      --   Don't forget to display the event ID:
      --
      --   Put_Line ("Event #" & Natural'Image (Event_ID));

end Event_Managers;
```

Listing 6: main.adb

```
with Ada.Command_Line; use Ada.Command_Line;
with Ada.Text_IO;      use Ada.Text_IO;

with Event_Managers;   use Event_Managers;
with Ada.Real_Time;    use Ada.Real_Time;

procedure Main is
   type Test_Case_Index is (Event_Manager_Chk);

   procedure Check (TC : Test_Case_Index) is
      Ev_Mng : array (1 .. 5) of Event_Manager;
   begin
      case TC is
         when Event_Manager_Chk =>
            for I in Ev_Mng'Range loop
               Ev_Mng (I).Start (I);
            end loop;
            Ev_Mng (1).Event (Clock + Seconds (5));
            Ev_Mng (2).Event (Clock + Seconds (3));
            Ev_Mng (3).Event (Clock + Seconds (1));
            Ev_Mng (4).Event (Clock + Seconds (2));
            Ev_Mng (5).Event (Clock + Seconds (4));
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

11.3 Generic Protected Queue

Goal: create a queue container using a protected type.

Steps:

1. Implement the generic package `Gen_Queues`.
    1. Declare the protected type `Queue`.
    2. Implement the `Empty` function.
    3. Implement the `Full` function.
    4. Implement the `Push` entry.
    5. Implement the `Pop` entry.

Requirements:

1. These are the formal parameters for the generic package `Gen_Queues`:
    1. a formal modular type;
        - This modular type should be used by the `Queue` to declare an array that stores the elements of the queue.
        - The modulus of the modular type must correspond to the maximum number of elements of the queue.
    2. the data type of the elements of the queue.
        - Select a formal parameter that allows you to store elements of any data type in the queue.
2. These are the operations of the `Queue` type:
    1. Function `Empty` indicates whether the queue is empty.
    2. Function `Full` indicates whether the queue is full.
    3. Entry `Push` stores an element in the queue.
    4. Entry `Pop` removes an element from the queue and returns the element via output parameter.

Remarks:

1. In this exercise, we create a queue container by declaring and implementing a protected type (`Queue`) as part of a generic package (`Gen_Queues`).
2. As a bonus exercise, you can analyze the body of the `Queue_Tests` package and understand how the `Queue` type is used there.
    1. In particular, the procedure `Concurrent_Test` implements two tasks: `T_Producer` and `T_Consumer`. They make use of the queue concurrently.

26       Put_Line ("Ignoring additional arguments...");
27    end if;
28
29    Check (Test_Case_Index'Value (Argument (1)));
30 end Main;
```

CHAPTER

TWELVE

DESIGN BY CONTRACTS

12.1 Price Range

Goal: use predicates to indicate the correct range of prices.

Steps:

1. Complete the `Prices` package.
    1. Rewrite the type declaration of `Price`.

Requirements:

1. Type `Price` must use a predicate instead of a range.

Remarks:

1. As discussed in the course, ranges are a form of contract.
    1. For example, the subtype `Price` below indicates that a value of this subtype must always be positive:

        ```
        subtype Price is Amount range 0.0 .. Amount'Last;
        ```

    2. Interestingly, you can replace ranges by predicates, which is the goal of this exercise.

Listing 1: prices.ads

```
package Prices is

   type Amount is delta 10.0 ** (-2) digits 12;

   subtype Price is Amount range 0.0 .. Amount'Last;

end Prices;
```

Listing 2: main.adb

```
with Ada.Command_Line;  use Ada.Command_Line;
with Ada.Text_IO;       use Ada.Text_IO;
with System.Assertions; use System.Assertions;

with Prices;            use Prices;

procedure Main is

   type Test_Case_Index is
     (Price_Range_Chk);

```

(continues on next page)

(continued from previous page)

```
12    procedure Check (TC : Test_Case_Index) is
13
14       procedure Check_Range (A : Amount) is
15          P : constant Price := A;
16       begin
17          Put_Line ("Price: " & Price'Image (P));
18       end Check_Range;
19
20    begin
21       case TC is
22       when Price_Range_Chk =>
23          Check_Range (-2.0);
24       end case;
25    exception
26       when Constraint_Error =>
27          Put_Line ("Constraint_Error detected (NOT as expected).");
28       when Assert_Failure =>
29          Put_Line ("Assert_Failure detected (as expected).");
30    end Check;
31
32 begin
33    if Argument_Count < 1 then
34       Put_Line ("ERROR: missing arguments! Exiting...");
35       return;
36    elsif Argument_Count > 1 then
37       Put_Line ("Ignoring additional arguments...");
38    end if;
39
40    Check (Test_Case_Index'Value (Argument (1)));
41 end Main;
```

12.2 Pythagorean Theorem: Predicate

Goal: use the Pythagorean theorem as a predicate.

Steps:

1. Complete the `Triangles` package.
    1. Add a predicate to the `Right_Triangle` type.

Requirements:

1. The `Right_Triangle` type must use the Pythagorean theorem as a predicate to ensure that its components are consistent.

Remarks:

1. As you probably remember, the Pythagoras' theorem[2] states that the square of the hypotenuse of a right triangle is equal to the sum of the squares of the other two sides.

Listing 3: triangles.ads

   function Image (T : Right_Triangle) return String is
     ("("    & Length'Image (T.H)
      & ", " & Length'Image (T.C1)
      & ", " & Length'Image (T.C2)
      & ")");

end Triangles.IO;
```

Listing 6: main.adb

```
with Ada.Command_Line;  use Ada.Command_Line;
with Ada.Text_IO;       use Ada.Text_IO;
with System.Assertions; use System.Assertions;

with Triangles;         use Triangles;
with Triangles.IO;      use Triangles.IO;

procedure Main is

   type Test_Case_Index is
     (Triangle_8_6_Pass_Chk,
      Triangle_8_6_Fail_Chk,
      Triangle_10_24_Pass_Chk,
      Triangle_10_24_Fail_Chk,
      Triangle_18_24_Pass_Chk,
      Triangle_18_24_Fail_Chk);

   procedure Check (TC : Test_Case_Index) is

      procedure Check_Triangle (H, C1, C2 : Length) is
         T : Right_Triangle;
      begin
         T := Init (H, C1, C2);
         Put_Line (Image (T));
      exception
         when Constraint_Error =>
```

(continues on next page)

(continued from previous page)

```
            Put_Line ("Constraint_Error detected (NOT as expected).");
         when Assert_Failure =>
            Put_Line ("Assert_Failure detected (as expected).");
      end Check_Triangle;

   begin
      case TC is
         when Triangle_8_6_Pass_Chk   => Check_Triangle (10,  8,  6);
         when Triangle_8_6_Fail_Chk   => Check_Triangle (12,  8,  6);
         when Triangle_10_24_Pass_Chk => Check_Triangle (26, 10, 24);
         when Triangle_10_24_Fail_Chk => Check_Triangle (12, 10, 24);
         when Triangle_18_24_Pass_Chk => Check_Triangle (30, 18, 24);
         when Triangle_18_24_Fail_Chk => Check_Triangle (32, 18, 24);
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

12.3 Pythagorean Theorem: Precondition

Goal: use the Pythagorean theorem as a precondition.

Steps:

1. Complete the `Triangles` package.
    1. Add a precondition to the `Init` function.

Requirements:

1. The `Init` function must use the Pythagorean theorem as a precondition to ensure that the input values are consistent.

Remarks:

1. In this exercise, you'll work again with the `Right_Triangle` type.
    1. This time, your job is to use a precondition instead of a predicate.
    2. The precondition is applied to the `Init` function, not to the `Right_Triangle` type.

Listing 7: triangles.ads

```
package Triangles is

   subtype Length is Integer;

   type Right_Triangle is record
      H      : Length := 0;
      --  Hypotenuse
      C1, C2 : Length := 0;
      --  Catheti / legs
```

(continues on next page)

(continued from previous page)

```
   end record;

   function Init (H, C1, C2 : Length) return Right_Triangle is
     ((H, C1, C2));

end Triangles;
```

48       Put_Line ("Ignoring additional arguments...");
49    end if;
50
51    Check (Test_Case_Index'Value (Argument (1)));
52 end Main;
```

12.4 Pythagorean Theorem: Postcondition

Goal: use the Pythagorean theorem as a postcondition.

Steps:

1. Complete the `Triangles` package.
    1. Add a postcondition to the `Init` function.

Requirements:

1. The `Init` function must use the Pythagorean theorem as a postcondition to ensure that the returned object is consistent.

Remarks:

1. In this exercise, you'll work again with the `Triangles` package.
    1. This time, your job is to apply a postcondition instead of a precondition to the `Init` function.

Listing 11: triangles.ads

```
1  package Triangles is
2
3     subtype Length is Integer;
4
5     type Right_Triangle is record
6        H      : Length := 0;
7        --  Hypotenuse
8        C1, C2 : Length := 0;
9        --  Catheti / legs
10    end record;

   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

12.5 Pythagorean Theorem: Type Invariant

Goal: use the Pythagorean theorem as a type invariant.

Steps:

1. Complete the `Triangles` package.
    1. Add a type invariant to the `Right_Triangle` type.

Requirements:

1. `Right_Triangle` is a private type.
    1. It must use the Pythagorean theorem as a type invariant to ensure that its encapsulated components are consistent.

Remarks:

1. In this exercise, `Right_Triangle` is declared as a private type.
    1. In this case, we use a type invariant for `Right_Triangle` to check the Pythagorean theorem.
2. As a bonus, after completing the exercise, you may analyze the effect that default values have on type invariants.
    1. For example, the declaration of `Right_Triangle` uses zero as the default values of the three triangle lengths.
    2. If you replace those default values with `Length'Last`, you'll get different results.
    3. Make sure you understand why this is happening.

Listing 15: triangles.ads

```
package Triangles is

   subtype Length is Integer;

   type Right_Triangle is private;

   function Init (H, C1, C2 : Length) return Right_Triangle;

private

   type Right_Triangle is record
      H      : Length := 0;
```

39          when Triangle_18_24_Fail_Chk => Check_Triangle (32, 18, 24);
40       end case;
41    end Check;
42
43 begin
44    if Argument_Count < 1 then
45       Put_Line ("ERROR: missing arguments! Exiting...");
46       return;
47    elsif Argument_Count > 1 then
48       Put_Line ("Ignoring additional arguments...");
49    end if;
50
51    Check (Test_Case_Index'Value (Argument (1)));
52 end Main;
```

12.6 Primary Color

Goal: extend a package for HTML colors so that it can handle primary colors.

Steps:

1. Complete the `Color_Types` package.
    1. Declare the `HTML_RGB_Color` subtype.
    2. Implement the `To_Int_Color` function.

Requirements:

1. The `HTML_Color` type is an enumeration that contains a list of HTML colors.
2. The `To_RGB_Lookup_Table` array implements a lookup-table to convert the colors into a hexadecimal value using RGB color components (i.e. `Red`, `Green` and `Blue`)
3. Function `To_Int_Color` extracts one of the RGB components of an HTML color and returns its hexadecimal value.
    1. The function has two parameters:
        - First parameter is the HTML color (`HTML_Color` type).
        - Second parameter indicates which RGB component is to be extracted from the HTML color (`HTML_RGB_Color` subtype).
    2. For example, if we call `To_Int_Color (Salmon, Red)`, the function returns #FA,
        - This is the hexadecimal value of the red component of the `Salmon` color.
        - You can find further remarks below about this color as an example.
4. The `HTML_RGB_Color` subtype is limited to the primary RGB colors components (i.e. `Red`, `Green` and `Blue`).
    1. This subtype is used to select the RGB component in calls to `To_Int_Color`.

2. You must use a predicate in the type declaration.

Remarks:

1. In this exercise, we reuse the code of the `Colors: Lookup-Table` exercise from the *Arrays* (page 43) labs.
2. These are the hexadecimal values of the colors that we used in the original exercise:

Color	Value
Salmon	#FA8072
Firebrick	#B22222
Red	#FF0000
Darkred	#8B0000
Lime	#00FF00
Forestgreen	#228B22
Green	#008000
Darkgreen	#006400
Blue	#0000FF
Mediumblue	#0000CD
Darkblue	#00008B

3. You can extract the hexadecimal value of each primary color by splitting the values from the table above into three hexadecimal values with two digits each.
   - For example, the hexadecimal value of `Salmon` is `#FA8072`, where:
     - the first part of this hexadecimal value (`#FA`) corresponds to the red component,
     - the second part (`#80`) corresponds to the green component, and
     - the last part (`#72`) corresponds to the blue component.

Listing 19: color_types.ads

```
package Color_Types is

   type HTML_Color is
     (Salmon,
      Firebrick,
      Red,
      Darkred,
      Lime,
      Forestgreen,
      Green,
      Darkgreen,
      Blue,
      Mediumblue,
      Darkblue);

   subtype Int_Color is Integer range 0 .. 255;

   function Image (I : Int_Color) return String;

   type RGB is record
      Red   : Int_Color;
      Green : Int_Color;
      Blue  : Int_Color;
   end record;

   function To_RGB (C : HTML_Color) return RGB;
```

(continues on next page)

43 end Main;
```

CHAPTER

THIRTEEN

OBJECT-ORIENTED PROGRAMMING

13.1 Simple type extension

Goal: work with type extensions using record types containing numeric components.

Steps:

1. Implement the `Type_Extensions` package.
    1. Declare the record type `T_Float`.
    2. Declare the record type `T_Mixed`
    3. Implement the `Init` function for the `T_Float` type with a floating-point input parameter.
    4. Implement the `Init` function for the `T_Float` type with an integer input parameter.
    5. Implement the `Image` function for the `T_Float` type.
    6. Implement the `Init` function for the `T_Mixed` type with a floating-point input parameter.
    7. Implement the `Init` function for the `T_Mixed` type with an integer input parameter.
    8. Implement the `Image` function for the `T_Mixed` type.

Requirements:

1. Record type `T_Float` contains the following component:
    1. `F`, a floating-point type.
2. Record type `T_Mixed` is derived from the `T_Float` type.
    1. `T_Mixed` extends `T_Float` with the following component:
        1. `I`, an integer component.
    2. Both components must be numerically *synchronized*:
        - For example, if the floating-point component contains the value 2.0, the value of the integer component must be 2.
        - In order to simplify the implementation, you can simply use `Integer (F)` to convert a floating-point variable `F` to integer.
3. Function `Init` returns an object of the corresponding type (`T_Float` or `T_Mixed`).
    1. For each type, two versions of `Init` must be declared:
        1. one with a floating-point input parameter,
        2. another with an integer input parameter.
    2. The parameter to `Init` is used to initialize the record components.

4. Function Image returns a string for the components of the record type.
    1. In case of the Image function for the T_Float type, the string must have the format "{ F => <float value> }".
        - For example, the call Image (T_Float'(Init (8.0))) should return the string "{ F => 8.00000E+00 }".
    2. In case of the Image function for the T_Mixed type, the string must have the format "{ F => <float value>, I => <integer value> }".
        - For example, the call Image (T_Mixed'(Init (8.0))) should return the string "{ F => 8.00000E+00, I => 8 }".

Listing 1: type_extensions.ads

```
package Type_Extensions is

   --  Create declaration of T_Float type!
   type T_Float is null record;

   --  function Init ...

   --  function Image ...

   --  Create declaration of T_Mixed type!
   type T_Mixed is null record;

end Type_Extensions;
```

with Ada.Text_IO;      use Ada.Text_IO;

with Type_Extensions;  use Type_Extensions;

procedure Main is

   type Test_Case_Index is
     (Type_Extension_Chk);

   procedure Check (TC : Test_Case_Index) is
      F1, F2 : T_Float;
      M1, M2 : T_Mixed;
   begin
      case TC is
      when Type_Extension_Chk =>
         F1 := Init (2.0);
         F2 := Init (3);
         M1 := Init (4.0);
         M2 := Init (5);

         if M2 in T_Float'Class then
           Put_Line ("T_Mixed is in T_Float'Class as expected");
         end if;

```

(continues on next page)

(continued from previous page)

```
         Put_Line ("F1: " & Image (F1));
         Put_Line ("F2: " & Image (F2));
         Put_Line ("M1: " & Image (M1));
         Put_Line ("M2: " & Image (M2));
      end case;
   end Check;

begin
   if Argument_Count < 1 then
      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

13.2 Online Store

Goal: create an online store for the members of an association.

Steps:

1. Implement the `Online_Store` package.
    1. Declare the `Member` type.
    2. Declare the `Full_Member` type.
    3. Implement the `Get_Status` function for the `Member` type.
    4. Implement the `Get_Price` function for the `Member` type.
    5. Implement the `Get_Status` function for the `Full_Member` type.
    6. Implement the `Get_Price` function for the `Full_Member` type.
2. Implement the `Online_Store.Tests` child package.
    1. Implement the `Simple_Test` procedure.

Requirements:

1. Package `Online_Store` implements an online store application for the members of an association.
    1. In this association, members can have one of the following status:
        - associate member, or
        - full member.
2. Function `Get_Price` returns the correct price of an item.
    1. Associate members must pay the full price when they buy items from the online store.
    2. Full members can get a discount.
        1. The discount rate can be different for each full member — depending on factors that are irrelevant for this exercise.
3. Package `Online_Store` has following types:
    1. `Percentage` type, which represents a percentage ranging from 0.0 to 1.0.

2. `Member` type for associate members containing following components:
   - `Start`, which indicates the starting year of the membership.
     - This information is common for both associate and full members.
     - You can use the `Year_Number` type from the standard `Ada.Calendar` package for this component.
3. `Full_Member` type for full members.
   1. This type must extend the `Member` type above.
   2. It contains the following additional component:
      - `Discount`, which indicates the discount rate that the full member gets in the online store.
        - This component must be of `Percentage` type.
4. For the `Member` and `Full_Member` types, you must implement the following functions:
   1. `Get_Status`, which returns a string with the membership status.
      - The string must be `"Associate Member"` or `"Full Member"`, respectively.
   2. `Get_Price`, which returns the *adapted price* of an item — indicating the actual due amount.
      - For example, for a full member with a 10% discount rate, the actual due amount of an item with a price of 100.00 is 90.00.
      - Associated members don't get a discount, so they always pay the full price.
5. Procedure `Simple_Test` (from the `Online_Store.Tests` package) is used for testing.
   1. Based on a list of members that bought on the online store and the corresponding full price of the item, `Simple_Test` must display information about each member and the actual due amount after discounts.
   2. Information about the members must be displayed in the following format:

```
Member # <number>
Status: <status>
Since:  <year>
Due Amount:  <value>
--------
```

   3. For this exercise, `Simple_Test` must use the following list:

#	Membership status	Start (year)	Discount	Full Price
1	Associate	2010	*N/A*	250.00
2	Full	1998	10.0 %	160.00
3	Full	1987	20.0 %	400.00
4	Associate	2013	*N/A*	110.00

   4. In order to pass the tests, the information displayed by a call to `Simple_Test` must conform to the format described above.
      - You can find another example in the remarks below.

Remarks:

1. In previous labs, we could have implemented a simplified version of the system described above by simply using an enumeration type to specify the membership status. For example:

```
type Member_Status is (Associate_Member, Full_Member);
```

1. In this case, the `Get_Price` function would then evaluate the membership status and adapt the item price — assuming a fixed discount rate for all full members. This could be the corresponding function declaration:

   ```
   type Amount is delta 10.0**(-2) digits 10;

   function Get_Price (M : Member_Status;
                       P : Amount) return Amount;
   ```

2. In this exercise, however, we'll use type extension to represent the membership status in our application.

2. For the procedure `Simple_Test`, let's consider the following list of members as an example:

#	Membership status	Start (year)	Discount	Full Price
1	Associate	2002	*N/A*	100.00
2	Full	2005	10.0 %	100.00

   - For this list, the test procedure displays the following information (in this exact format):

     ```
     Member # 1
     Status: Associate Member
     Since:  2002
     Due Amount:  100.00
     --------
     Member # 2
     Status: Full Member
     Since:  2005
     Due Amount:  90.00
     --------
     ```

   - Here, although both members had the same full price (as indicated by the last column), member #2 gets a reduced due amount of 90.00 because of the full membership status.

Listing 4: online_store.ads

```
1  with Ada.Calendar; use Ada.Calendar;
2
3  package Online_Store is
4
5     type Amount is delta 10.0**(-2) digits 10;
6
7     subtype Percentage is Amount range 0.0 .. 1.0;
8
9     --  Create declaration of Member type!
10    --
11    --  You can use Year_Number from Ada.Calendar for the membership
12    --  starting year.
13    --
14    type Member is null record;
15
16    function Get_Status (M : Member) return String;
17
18    function Get_Price (M : Member;
19                        P : Amount) return Amount;
```

(continues on next page)

(continued from previous page)

```

CHAPTER

FOURTEEN

STANDARD LIBRARY: CONTAINERS

14.1 Simple todo list

Goal: implement a simple to-do list system using vectors.

Steps:

1. Implement the `Todo_Lists` package.
    1. Declare the `Todo_Item` type.
    2. Declare the `Todo_List` type.
    3. Implement the `Add` procedure.
    4. Implement the `Display` procedure.
2. `Todo_Item` type is used to store to-do items.
    1. It should be implemented as an access type to strings.
3. `Todo_List` type is the container for all to-do items.
    1. It should be implemented as a **vector**.
4. Procedure `Add` adds items (of `Todo_Item` type) to the list (of `Todo_List` type).
    1. This requires allocating a string for the access type.
5. Procedure `Display` is used to display all to-do items.
    1. It must display one item per line.

Remarks:

1. This exercise is based on the *Simple todo list* exercise from the *More About Types* (page 61).
    1. Your goal is to rewrite that exercise using vectors instead of arrays.
    2. You may reuse the code you've already implemented as a starting point.

Listing 1: todo_lists.ads

```
1  package Todo_Lists is
2
3     type Todo_Item is access String;
4
5     type Todo_List is null record;
6
7     procedure Add (Todos : in out Todo_List;
8                    Item  : String);
9
10    procedure Display (Todos : Todo_List);
```

(continues on next page)

(continued from previous page)

```
11
12 end Todo_Lists;
```

Listing 2: todo_lists.adb

```
1  with Ada.Text_IO; use Ada.Text_IO;
2
3  package body Todo_Lists is
4
5     procedure Add (Todos : in out Todo_List;
6                    Item  : String) is
7     begin
8        null;
9     end Add;
10
11    procedure Display (Todos : Todo_List) is
12    begin
13       Put_Line ("TO-DO LIST");
14    end Display;
15
16 end Todo_Lists;
```

Listing 3: main.adb

```
1  with Ada.Command_Line;  use Ada.Command_Line;
2  with Ada.Text_IO;       use Ada.Text_IO;
3
4  with Todo_Lists;        use Todo_Lists;
5
6  procedure Main is
7     type Test_Case_Index is
8       (Todo_List_Chk);
9
10    procedure Check (TC : Test_Case_Index) is
11       T : Todo_List;
12    begin
13       case TC is
14          when Todo_List_Chk =>
15             Add (T, "Buy milk");
16             Add (T, "Buy tea");
17             Add (T, "Buy present");
18             Add (T, "Buy tickets");
19             Add (T, "Pay electricity bill");
20             Add (T, "Schedule dentist appointment");
21             Add (T, "Call sister");
22             Add (T, "Revise spreasheet");
23             Add (T, "Edit entry page");
24             Add (T, "Select new design");
25             Add (T, "Create upgrade plan");
26             Display (T);
27       end case;
28    end Check;
29
30 begin
31    if Argument_Count < 1 then
32       Put_Line ("ERROR: missing arguments! Exiting...");
33       return;
34    elsif Argument_Count > 1 then
35       Put_Line ("Ignoring additional arguments...");
36    end if;
```

(continues on next page)

(continued from previous page)

```
37
38    Check (Test_Case_Index'Value (Argument (1)));
39 end Main;
```

14.2 List of unique integers

Goal: create function that removes duplicates from and orders a collection of elements.

Steps:

1. Implement package `Ops`.
    1. Declare the `Int_Array` type.
    2. Declare the `Integer_Sets` type.
    3. Implement the `Get_Unique` function that returns a set.
    4. Implement the `Get_Unique` function that returns an array of integer values.

Requirements:

1. The `Int_Array` type is an unconstrained array of positive range.
2. The `Integer_Sets` package is an instantiation of the `Ordered_Sets` package for the **`Integer`** type.
3. The `Get_Unique` function must remove duplicates from an input array of integer values and order the elements.
    1. For example:
        - if the input array contains `(7, 7, 1)`
        - the function must return `(1, 7)`.
    2. You must implement this function by using sets from the `Ordered_Sets` package.
    3. `Get_Unique` must be implemented in two versions:
        - one version that returns a set — `Set` type from the `Ordered_Sets` package.
        - one version that returns an array of integer values — `Int_Array` type.

Remarks:

1. Sets — as the one found in the generic `Ordered_Sets` package — are useful for quickly and easily creating an algorithm that removes duplicates from a list of elements.

Listing 4: ops.ads

```
1  with Ada.Containers.Ordered_Sets;
2
3  package Ops is
4
5     --  type Int_Array is ...
6
7     --  package Integer_Sets is ...
8
9     subtype Int_Set is Integer_Sets.Set;
10
11    function Get_Unique (A : Int_Array) return Int_Set;
12
13    function Get_Unique (A : Int_Array) return Int_Array;
```

(continues on next page)

(continued from previous page)

```
14
15 end Ops;
```

Listing 5: ops.adb

```
1  package body Ops is
2
3     function Get_Unique (A : Int_Array) return Int_Set is
4     begin
5        null;
6     end Get_Unique;
7
8     function Get_Unique (A : Int_Array) return Int_Array is
9     begin
10       null;
11    end Get_Unique;
12
13 end Ops;
```

Listing 6: main.adb

```
1  with Ada.Command_Line;          use Ada.Command_Line;
2  with Ada.Text_IO;               use Ada.Text_IO;
3
4  with Ops;                       use Ops;
5
6  procedure Main is
7     type Test_Case_Index is
8       (Get_Unique_Set_Chk,
9        Get_Unique_Array_Chk);
10
11    procedure Check (TC : Test_Case_Index;
12                     A  : Int_Array) is
13
14       procedure Display_Unique_Set (A : Int_Array) is
15          S  : constant Int_Set := Get_Unique (A);
16       begin
17          for E of S loop
18             Put_Line (Integer'Image (E));
19          end loop;
20       end Display_Unique_Set;
21
22       procedure Display_Unique_Array (A : Int_Array) is
23          AU : constant Int_Array := Get_Unique (A);
24       begin
25          for E of AU loop
26             Put_Line (Integer'Image (E));
27          end loop;
28       end Display_Unique_Array;
29
30    begin
31       case TC is
32          when Get_Unique_Set_Chk   => Display_Unique_Set (A);
33          when Get_Unique_Array_Chk => Display_Unique_Array (A);
34       end case;
35    end Check;
36
37 begin
38    if Argument_Count < 3 then
39       Put_Line ("ERROR: missing arguments! Exiting...");
```

(continues on next page)

(continued from previous page)

```
40          return;
41       else
42          declare
43             A : Int_Array (1 .. Argument_Count - 1);
44          begin
45             for I in A'Range loop
46                A (I) := Integer'Value (Argument (1 + I));
47             end loop;
48             Check (Test_Case_Index'Value (Argument (1)), A);
49          end;
50       end if;
51    end Main;
```

CHAPTER

FIFTEEN

STANDARD LIBRARY: DATES & TIMES

15.1 Holocene calendar

Goal: create a function that returns the year in the Holocene calendar.

Steps:

1. Implement the `To_Holocene_Year` function.

Requirements:

1. The `To_Holocene_Year` extracts the year from a time object (`Time` type) and returns the corresponding year for the Holocene calendar[3].
    1. For positive (AD) years, the Holocene year is calculated by adding 10,000 to the year number.

Remarks:

1. In this exercise, we don't deal with BC years.
2. Note that the year component of the `Time` type from the `Ada.Calendar` package is limited to years starting with 1901.

Listing 1: to_holocene_year.adb

```
with Ada.Calendar; use Ada.Calendar;

function To_Holocene_Year (T : Time) return Integer is
begin
   return 0;
end To_Holocene_Year;
```

Listing 2: main.adb

```
with Ada.Command_Line;        use Ada.Command_Line;
with Ada.Text_IO;             use Ada.Text_IO;
with Ada.Calendar;            use Ada.Calendar;

with To_Holocene_Year;

procedure Main is
   type Test_Case_Index is
     (Holocene_Chk);

   procedure Display_Holocene_Year (Y : Year_Number) is
      HY : Integer;
   begin
```

(continues on next page)

[3] https://en.wikipedia.org/wiki/Holocene_calendar

(continued from previous page)

```
14       HY := To_Holocene_Year (Time_Of (Y, 1, 1));
15       Put_Line ("Year (Gregorian): " & Year_Number'Image (Y));
16       Put_Line ("Year (Holocene):  " & Integer'Image (HY));
17    end Display_Holocene_Year;
18
19    procedure Check (TC : Test_Case_Index) is
20    begin
21       case TC is
22          when Holocene_Chk =>
23             Display_Holocene_Year (2012);
24             Display_Holocene_Year (2020);
25       end case;
26    end Check;
27
28 begin
29    if Argument_Count < 1 then
30       Put_Line ("ERROR: missing arguments! Exiting...");
31       return;
32    elsif Argument_Count > 1 then
33       Put_Line ("Ignoring additional arguments...");
34    end if;
35
36    Check (Test_Case_Index'Value (Argument (1)));
37 end Main;
```

15.2 List of events

Goal: create a system to manage a list of events.

Steps:

1. Implement the `Events` package.
    1. Declare the `Event_Item` type.
    2. Declare the `Event_Items` type.
2. Implement the `Events.Lists` package.
    1. Declare the `Event_List` type.
    2. Implement the `Add` procedure.
    3. Implement the `Display` procedure.

Requirements:

1. The `Event_Item` type (from the `Events` package) contains the *description of an event*.
    1. This description shall be stored in an access-to-string type.
2. The `Event_Items` type stores a list of events.
    1. This will be used later to represent multiple events for a specific date.
    2. You shall use a vector for this type.
3. The `Events.Lists` package contains the subprograms that are used in the test application.
4. The `Event_List` type (from the `Events.Lists` package) maps a list of events to a specific date.
    1. You must use the `Event_Items` type for the list of events.

2. You shall use the `Time` type from the `Ada.Calendar` package for the dates.
3. Since we expect the events to be ordered by the date, you shall use ordered maps for the `Event_List` type.

5. Procedure `Add` adds an event into the list of events for a specific date.
6. Procedure `Display` must display all events for each date (ordered by date) using the following format:

```
<event_date #1>
    <description of item #1a>
    <description of item #1b>
<event_date #2>
    <description of item #2a>
    <description of item #2b>
```

1. You should use the auxiliary `Date_Image` function — available in the body of the `Events.Lists` package — to display the date in the `YYYY-MM-DD` format.

Remarks:

1. Let's briefly illustrate the expected output of this system.
   1. Consider the following example:

```
with Ada.Calendar;
with Ada.Calendar.Formatting; use Ada.Calendar.Formatting;

with Events.Lists;            use Events.Lists;

procedure Test is
   EL : Event_List;
begin
   EL.Add (Time_Of (2019, 4, 16),
           "Item #2");
   EL.Add (Time_Of (2019, 4, 15),
           "Item #1");
   EL.Add (Time_Of (2019, 4, 16),
           "Item #3");
   EL.Display;
end Test;
```

   2. The expected output of the `Test` procedure must be:

```
EVENTS LIST
- 2019-04-15
    - Item #1
- 2019-04-16
    - Item #2
    - Item #3
```

Listing 3: events.ads

```
1  package Events is
2
3     type Event_Item is null record;
4
5     type Event_Items is null record;
6
7  end Events;
```

Listing 4: events-lists.ads

```
with Ada.Calendar; use Ada.Calendar;

package Events.Lists is

   type Event_List is tagged private;

   procedure Add (Events     : in out Event_List;
                  Event_Time :        Time;
                  Event      :        String);

   procedure Display (Events : Event_List);

private

   type Event_List is tagged null record;

end Events.Lists;
```

Listing 5: events-lists.adb

```

11
12    procedure Check (TC : Test_Case_Index) is
13       EL : Event_List;
14    begin
15       case TC is
16          when Event_List_Chk =>
17             EL.Add (Time_Of (2018, 2, 16),
18                     "Final check");
19             EL.Add (Time_Of (2018, 2, 16),
20                     "Release");
21             EL.Add (Time_Of (2018, 12, 3),
22                     "Brother's birthday");
23             EL.Add (Time_Of (2018, 1, 1),
24                     "New Year's Day");
25             EL.Display;
26       end case;
27    end Check;
28
29 begin
30    if Argument_Count < 1 then
31       Put_Line ("ERROR: missing arguments! Exiting...");
32       return;
33    elsif Argument_Count > 1 then
34       Put_Line ("Ignoring additional arguments...");
35    end if;
36
37    Check (Test_Case_Index'Value (Argument (1)));
38 end Main;
```

CHAPTER

SIXTEEN

STANDARD LIBRARY: STRINGS

16.1 Concatenation

Goal: implement functions to concatenate an array of unbounded strings.

Steps:

1. Implement the `Str_Concat` package.
    1. Implement the `Concat` function for `Unbounded_String`.
    2. Implement the `Concat` function for **`String`**.

Requirements:

1. The first `Concat` function receives an unconstrained array of unbounded strings and returns the concatenation of those strings as an unbounded string.
    1. The second `Concat` function has the same parameters, but returns a standard string (**`String`** type).
2. Both `Concat` functions have the following parameters:
    1. An unconstrained array of `Unbounded_String` strings (`Unbounded_Strings` type).
    2. `Trim_Str`, a Boolean parameter indicating whether each unbounded string must be trimmed.
    3. `Add_Whitespace`, a Boolean parameter indicating whether a whitespace shall be added between each unbounded string and the next one.
        1. No whitespace shall be added after the last string of the array.

Remarks:

1. You can use the `Trim` function from the `Ada.Strings.Unbounded` package.

Listing 1: str_concat.ads

```
with Ada.Strings.Unbounded; use Ada.Strings.Unbounded;

package Str_Concat is

   type Unbounded_Strings is array (Positive range <>) of Unbounded_String;

   function Concat (USA            : Unbounded_Strings;
                    Trim_Str       : Boolean;
                    Add_Whitespace : Boolean) return Unbounded_String;

   function Concat (USA            : Unbounded_Strings;
                    Trim_Str       : Boolean;
                    Add_Whitespace : Boolean) return String;
```

(continues on next page)

(continued from previous page)

```
14
15 end Str_Concat;
```

Listing 2: str_concat.adb

```
1  with Ada.Strings; use Ada.Strings;
2
3  package body Str_Concat is
4
5     function Concat (USA            : Unbounded_Strings;
6                      Trim_Str       : Boolean;
7                      Add_Whitespace : Boolean) return Unbounded_String is
8     begin
9        return "";

16.2 List of events

Goal: create a system to manage a list of events.

Steps:

1. Implement the `Events` package.
    1. Declare the `Event_Item` subtype.
2. Implement the `Events.Lists` package.
    1. Adapt the `Add` procedure.
    2. Adapt the `Display` procedure.

Requirements:

1. The `Event_Item` type (from the `Events` package) contains the *description of an event*.
    1. This description is declared as a subtype of unbounded string.
2. Procedure `Add` adds an event into the list of events for a specific date.
    1. The declaration of `E` needs to be adapted to use unbounded strings.
3. Procedure `Display` must display all events for each date (ordered by date) using the following format:
    1. The arguments to `Put_Line` need to be adapted to use unbounded strings.

Remarks:

1. We use the lab on the list of events from the previous chapter (*Standard library: Dates & Times* (page 133)) as a starting point.

Listing 4: events.ads

```

CHAPTER

SEVENTEEN

STANDARD LIBRARY: NUMERICS

17.1 Decibel Factor

Goal: implement functions to convert from Decibel values to factors and vice-versa.

Steps:

1. Implement the `Decibels` package.
    1. Implement the `To_Decibel` function.
    2. Implement the `To_Factor` function.

Requirements:

1. The subtypes `Decibel` and `Factor` are based on a floating-point type.
2. Function `To_Decibel` converts a multiplication factor (or ratio) to decibels.
    - For the implementation, use $20 * log_{10}(F)$, where *F* is the factor/ratio.
3. Function `To_Factor` converts a value in decibels to a multiplication factor (or ratio).
    - For the implementation, use $10^{D/20}$, where *D* is the value in Decibel.

Remarks:

1. The Decibel[4] is used to express the ratio of two values on a logarithmic scale.
    1. For example, an increase of 6 dB corresponds roughly to a multiplication by two (or an increase by 100 % of the original value).
2. You can find the functions that you'll need for the calculation in the `Ada.Numerics.Elementary_Functions` package.

Listing 1: decibels.ads

```
package Decibels is

   subtype Decibel is Float;
   subtype Factor  is Float;

   function To_Decibel (F : Factor) return Decibel;

   function To_Factor (D : Decibel) return Factor;

end Decibels;
```

      Put_Line ("ERROR: missing arguments! Exiting...");
      return;
   elsif Argument_Count > 2 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)), Float'Value (Argument (2)));
end Main;
```

17.2 Root-Mean-Square

Goal: implement a function to calculate the root-mean-square of a sequence of values.

Steps:

1. Implement the `Signals` package.
    1. Implement the `Rms` function.

Requirements:

1. Subtype `Sig_Value` is based on a floating-point type.
2. Type `Signal` is an unconstrained array of `Sig_Value` elements.
3. Function `Rms` calculates the RMS of a sequence of values stored in an array of type `Signal`.
    1. See the remarks below for a description of the RMS calculation.

Remarks:

1. The root-mean-square[5] (RMS) value is an important information associated with sequences of values.
    1. It's used, for example, as a measurement for signal processing.
    2. It is calculated by:
        1. Creating a sequence S with the square of each value of an input sequence S_{in}.
        2. Calculating the mean value M of the sequence S.
        3. Calculating the square-root R of M.
    3. You can optimize the algorithm above by combining steps #1 and #2 into a single step.

Listing 4: signals.ads

```
package Signals is

   subtype Sig_Value is Float;

   type Signal is array (Natural range <>) of Sig_Value;

   function Rms (S : Signal) return Sig_Value;

end Signals;
```

      return;
   elsif Argument_Count > 1 then
      Put_Line ("Ignoring additional arguments...");
   end if;

   Check (Test_Case_Index'Value (Argument (1)));
end Main;
```

17.3 Rotation

Goal: use complex numbers to calculate the positions of an object in a circle after rotation.

Steps:

1. Implement the `Rotation` package.
    1. Implement the `Rotation` function.

Requirements:

1. Type `Complex_Points` is an unconstrained array of complex values.
2. Function `Rotation` returns a list of positions (represented by the `Complex_Points` type) when dividing a circle in `N` equal slices.
    1. See the remarks below for a more detailed explanation.
    2. You must use functions from `Ada.Numerics.Complex_Types` to implement `Rotation`.
3. Subtype `Angle` is based on a floating-point type.
4. Type `Angles` is an unconstrained array of angles.
5. Function `To_Angles` returns a list of angles based on an input list of positions.

Remarks:

1. Complex numbers are particularly useful in computer graphics to simplify the calculation of rotations.
    1. For example, let's assume you've drawn an object on your screen on position (1.0, 0.0).
    2. Now, you want to move this object in a circular path — i.e. make it rotate around position (0.0, 0.0) on your screen.
        - You could use *sine* and *cosine* functions to calculate each position of the path.
        - However, you could also calculate the positions using complex numbers.
2. In this exercise, you'll use complex numbers to calculate the positions of an object that starts on zero degrees — on position (1.0, 0.0) — and rotates around (0.0, 0.0) for *N* slices of a circle.
    1. For example, if we divide the circle in four slices, the object's path will consist of following points / positions:

```
Point #1: ( 1.0,  0.0)
Point #2: ( 0.0,  1.0)
Point #3: (-1.0,  0.0)
Point #4: ( 0.0, -1.0)
Point #5: ( 1.0,  0.0)
```

        1. As expected, point #5 is equal to the starting point (point #1), since the object rotates around (0.0, 0.0) and returns to the starting point.
    2. We can also describe this path in terms of angles. The following list presents the angles for the path on a four-sliced circle:

```
Point #1:    0.00 degrees
Point #2:   90.00 degrees
Point #3:  180.00 degrees
Point #4:  -90.00 degrees (= 270 degrees)
Point #5:    0.00 degrees
```

1. To rotate a complex number simply multiply it by a unit vector whose arg is the radian angle to be rotated: $Z = e^{\frac{2\pi}{N}}$

Listing 9: rotation.ads

```
with Ada.Numerics.Complex_Types;
use  Ada.Numerics.Complex_Types;
